> Priscilla Yow 852 2869 3138 pyow@lehman.com

We have downgraded Hong Kong banks to NEUTRAL following their excellent performance in the past six months. We reiterate our OVERWEIGHT position on banks in Singapore and South Korea, while we remain negative on the remaining Asian banking sectors.

- While we agree that the US rate cuts will help improve investor sentiments, we are more cautious than the market in terms of the fundamental impact on Asian banks. Most banks in the region are facing country-specific problems such as deteriorating asset quality or political instability, which means that a lower interest rate environment does not necessarily translate to substantially higher credit demand.
- We have downgraded Hong Kong to NEUTRAL, given that the banks have rallied strongly in recent months in anticipation of interest rate cuts, and valuations are becoming increasingly stretched. Additionally, even after incorporating an additional 25bps reduction, we do not expect loans in Hong Kong to grow more than 5% in 2001 and 2002. Our view stems from the fact that the key driver for loan demand, the property-related sector, remains sluggish. We have downgraded Hang Seng Bank to 3-Market Perform.
- Given concerns of a "double-dip" recession in most Asian economies, Singaporean banks present good investment opportunities given the country's safe haven status. Loan demand has also picked up in recent months, especially among the consumer segment, while we expect capital management and rationalization to be addressed in 1Q01. We have recently upgraded Singaporean banks to OVERWEIGHT.
- We continue to recommend investors to OVERWEIGHT South Korean banks. The key drivers of the sector's price performance would be the successful and timely implementation of Round 2 of financial restructuring, which we expect in 1Q01, and a resilient consumer segment to support loan growth. Increased pace of mergers and acquisitions among the strong banks would be an added catalyst for share price performance.
- We recommend H&CB, Kookmin Bank, UOB and Bank Central Asia as our top picks for the Asian banking sector.

Investment Summary

2000 has been a trying year for most bank stocks in Asia. With the exception of Hong Kong, other banks in the region ended the year down in absolute terms. In Hong Kong, the banks gained 10% in absolute terms on average and outstripped the local index by 21%. We would also highlight that the healthy South Korean retail banks have handsomely outperformed the KOSPI index by an average of 35% to 39%. For the coming year, while the declining US interest rate scenario will help to improve investor sentiment towards the banking sector, we are more cautious than the market in terms of the fundamental impact of lower interest rates on loan growth.

In particular, we would highlight that we expect loan growth in Hong Kong to remain below 5% for the next years, lower interest rates notwithstanding. Our view stems from the fact that the key driver for Hong Kong loan demand, the property-related sectors, remains very sluggish. Additionally, we believe that share prices of most of the big cap banks have already discounted the interest rate cuts given the strong rally we witnessed in the past two months and as such we have less optimistic views of further outperformance. We continue to rate HSBC a 3-Market Perform, given our view that ROE for the bank has peaked and valuations are stretched at this juncture. We have also downgraded Hang Seng Bank from 2-Buy to 3-Market Perform, following its 40% increase in its share price over the last six months. Indeed, trading at 4.8x PBR, Hang Sang Bank is the most expensive banking stock in our universe. Consequently, we now recommend investors to adopt a NEUTRAL position in the Hong Kong banking sector.

We upgraded Singapore banks to OVERWEIGHT in the last week of 2000, and we take the opportunity to reiterate this view. We expect the US interest rate loosening to benefit the banks given that investors will focus on the interest rate sensitive sectors in the market. While loan growth has been weak for most of last year, we have seen some improvements in the most recent MAS releases. Specifically, lending to the consumer sector has been increasingly strong, growing by 12.9% year on year in October. Mortgage lending has also improved, mitigating the effects of rate cuts. Given its large exposures to the consumer and SME segments, coupled with its asset management expertise, we continue to rate UOB 1- Strong Buy as our top pick in the sector.

We recommend investors to remain OVERWEIGHT in South Korean banks in 2001. we expect the key drivers of the sector's price performance to be the successful and timely implementation of Round 2 of financial restructuring, which we expect in 1Q01, and a resilient consumer segment to support loan growth. Increased pace of mergers and acquisitions among the strong banks will be an added catalyst for share price performance. Already, we have heard announcements by H&CB and Kookmin Bank to merge with each other to form a retail-banking powerhouse. These two banks are our top picks in the sector, with 1-Strong Buy ratings on both stocks.

We are UNDERWEIGHT the banking sector for the remaining countries in Asia. Taiwan is besieged with rising non-performing assets, slow financial reforms and unstable

political environment. We would only recommend Chinatrust for exposure to the sector. In Malaysia, continued merger pains weigh down bank share price performance, and Maybank is the only bank we would advise investors to hold in an otherwise unattractive sector. Banks in Thailand, Indonesia and the Philippines will be adversely affected, to varying degrees, by political and social turmoil. Coupled with the fact that most banks are still grappling with their non-performing asset portfolio, we believe investors would do well by staying away from these countries. We have included BCA, however, as one of our top picks given our strong belief that the potential return from this stock far outweighs the risk of investing in Indonesia.

To Greenspan: Thanks for the cut

In a move that surprised the global markets, the US Fed announced a 50bps cut in the benchmark Fed Funds rate to 6.0% on January 3. The move came in-between the official FOMC meetings. The timing was four weeks earlier than most investors expected while the magnitude was also greater than most economists' forecasts. The Fed under Alan Greenspan's stewardship has traditionally been viewed as being partial to prescribing small doses and evaluating how the economy responds. Indeed, it is the first time that the Greenspan Fed initiated a 50bps change in what is expected to be a round of interest rate reductions. Our Lehman Brothers Global Economics team is forecasting an additional 25bps reduction in 1Q01. Any further reductions in the following quarters would largely depend on the how the US economy performs in the first three months of year.

The US interest rate cut is positive for sentiments in all Asian markets, and particularly so for the two big developed markets in Hong Kong and Singapore.

The Hong Kong market has factored in lower interest rates with bank stocks rising 15-20% over the last month. Bank stock have always been viewed as beneficiaries of lower interest rates, and the market has already factored this in. In fact we believe that current bank stock share prices have already factored in another 50-75 basis points decline in interest rates. Consequently, further multiple expansion will be difficult to achieve.

In Singapore, we likewise expect a US rate loosening to benefit loan volumes. We believe that one of the key drivers to overall loan growth will continue to be the consumer sector. In recent monthly MAS reports, consumer lending continues to advance at double-digit levels. We would highlight that personal income in Singapore is rising swiftly, which will help maintain this aggressive growth.

The US interest rate cut will have a less direct impact on the rest of Asia. The authorities in most of the rest of Asia have been contemplating rate cuts, not because of the US factor, but because of their rapidly deteriorating economies. In Taiwan, for example, the central bank cut its discount rate by 12.5bps to 4.625% in the last week of December 2000, a move that was widely viewed as necessary to boost the flagging economy. We would also point out that until December 2000, the Taiwanese authorities had not changed domestic interest rates for almost two years.

Nevertheless, lower US interest rates allow these countries to reduce interest rates without having to worry about the impact on their respective currencies. The overriding concern of the Taiwanese, Thai and the Philippine banks remains non-performing assets.

Wither loan growth?

Loan growth across the region was anemic in 2000, with the exception of loan growth in South Korea and Indonesia, despite strong rebounds in economic growth from 1999. Major economies like Hong Kong and Singapore are on track to register about 10%

GDP growth for 2000. These outstanding growth rates were achieved without any significant recovery in loan growth. As of November 2000, loan growth in Hong Kong inched up a feeble 2.8%, while loans in Singapore expanded by only 3.4% in the first ten months. This compares to more than 20% growth in the pre-crisis period for Hong Kong and Singapore. Indeed, this is one of the longest instances of a de-coupling of GDP/loan growth in recent memory.

Loan growth in Hong Kong is expected to be less than 5% in the next two years In Hong Kong, property-related lending was the key driver to overall loan growth in the first seven years of 1990, accounting for 68% of total growth. Unfortunately, all parties have to come to an end, and the property bubble burst with the onset of the Asian financial crisis. Hitherto, property prices have remained weak, resulting in smaller average mortgage sizes and the number of property transactions continues to slide as speculative demand has dried up. Furthermore, the lack of investment opportunities has resulted in increased loan pre-payments.

With the exception of some large syndicated loans to major blue-chip companies, Hong Kong banks have generally shied away from the corporate sector. This is due to the fact that this sector has been the source of the bulk of problem loans. Moreover, the healthier companies have been de-leveraging their balance sheets and have not indicated any desire to start borrowing again. Consequently the banks continue to rage a mortgage war, with rates hovering at Prime minus 225bps. Despite such competitive rates, however, outstanding mortgage loans have been flat over the past 18 months, illustrating that net demand for such loans is still extremely poor. While the recent interest rate cut in the U.S. and in domestic interest rates will help to stimulate some credit demand, we forecast overall loan growth in Hong Kong to remain below 5% for the next two years.

Consumer loans to boost loans in Singapore

In Singapore, consumer financing will continue to drive overall loan growth. In the first ten months of 2000, consumer lending jumped 12.9% year on year. This is especially notable given that overall loans grew by only 4%. The sector that dragged down overall loans was manufacturing, which declined 0.4% year on year. In an increasingly competitive environment, we expect the smaller banks (i.e. UOB and Keppel Tatlee) with niches in consumer and SME lending to steal market share. This year, on the back of a more interest rate friendly environment, we expect a healthy pick-up in overall loan growth to 9.4%, from an estimated 5.9% last year.

Buoyed by a resilient retailbanking segment, we expect loans in Korea to grow 16% this year Korea exhibited one of the strongest loan growths in 2000. For the first nine months of the year, overall loans were up 27% year on year, largely driven by retail loans, which expanded by almost 50%. The key drivers were mortgages and other personal finance loans, underscoring the resilient private sector consumption. Loans to the corporate sector also grew by a healthy 22%, albeit significantly behind retail loans. Rather than lending to the large corporates (chaebols), most banks have focused on small and medium-sized enterprises (SMEs) for corporate exposure. This year we expect overall loan growth to decelerate a more sustainable 16% and 14% in 2001 and 2002 respectively, especially taking into account the high base effect.

For the remaining larger economies in Asia (Taiwan and Malaysia), we expect loan growth to remain in mid-single digits. In Taiwan, the sector is besieged with anemic consumer demand given a weak property and stock market. While corporate loans have performed relatively well, we expect credit demand to taper off, especially with signs of a slowing electronics industry, the main driver for the Taiwanese economy. Rising NPLs have also led to banks being much more cautious in extending credit. In Malaysia, we expect the opposite to happen. Loan growth in the past year was driven by mortgages, which increased 16%. On the other hand, manufacturing loans managed to eke out only 4% growth. Looking ahead, we expect loan growth to be weak and banks to struggle to achieve loan growth of 5%8%.

Loan demand hurt by political woes in Thailand and the Philippines In the rest of Asia, we do not expect banks to register double-digit growth rates given the generally weak operating environment. In some of these countries, political uncertainties will continue to plague investor and business confidence, while others are still struggling to recover from their asset quality problems. In the Philippines for example, the on-going impeachment of President Estrada has seriously damaged business sentiment, which has led to weak corporate demand. Coupled with the increasing of domestic interest rates to protect the sliding peso in 4Q00, banks would have to focus more on controlling their rising non-performing assets.

In Thailand, the recent senate elections suggest the election process is unlikely to run smoothly, despite the recent passage of stricter election laws aimed at speeding up the election process. Multiple rounds of voting may still be needed to weed out candidates guilty of unlawful vote buying, before the Election Commission ultimately endorses the result. In addition, an ongoing corruption inquiry may lead to the current opposition leader being banned from taking office. This opens the door for increased political unrest, which would inevitably hurt business sentiment and credit demand. High-quality loans remain disappointingly scarce.

Consolidation Brewing

Consolidation in the banking sector is a theme that has been brewing for some time, but with few results. However, there is significant evidence that all Asian countries are overbanked. For example, banks below the top five control only small market shares, usually less than one percent, and cannot develop the economies of scale or don't have the balance sheet capacity or customer base to diversify their earnings bases. Such a structure is obviously not efficient and does not create economies of scale as well as provide for lower funding costs. Thus, the writing is on the wall– all Asian countries are over-banks and there is definitely a need to get bigger and better. However, what is the catalyst, other than government intervention?

In stable countries like Hong Kong and Singapore, the catalyst is likely to be declining profitability and the need for economies of scale to improve operating efficiencies. Developments in each of these countries point to consolidation picking up steam in 2001 and beyond. However, in distressed countries, the catalyst is likely to be either the government taking a bank over of orchestrating a deal.

The little consolidation that has occurred has primarily been in distressed countries, and have largely been government induced, both where the government plays the consolidator as well as the facilitator. Countries where the government has taken significant ownership stakes in the banking sector are Thailand and Indonesia. Meanwhile, the government has played the facilitator in Malaysia by "forcing" the country's 54 financial institutions to merge into ten anchor banks as well as Korea by merging four weak banks under a single holding company.

However, we prefer market driven mergers, whereby the goal is to achieve cost savings and/or revenue enhancement. This has been more the case in Hong Kong and Singapore, where the goal is to improve profitability rather than simply to survive.

Nevertheless, no matter which route is taken, the goal is to create larger and better institutions that will be better equipped to compete against foreign competition as the local markets open up to foreign banks.

Hong Kong: Still too profitable In Hong Kong, although there is a compelling argument that the territory is over-banked, there are few catalysts to encourage further consolidation in the industry in the near term. Banks are profitable, currently generating ROEs of 10-15%. In addition, many banks are owned and controlled by family interests, who are unwilling to give up the prestige of ownership as well as the strong recurrent cash flow generated from these banks. Two transactions occurred in 2000- BEA acquired FPB Bank and Standard Chartered acquired Chase's retail operations. Both transactions were driven by the fact that the major shareholders wanted to exit the banking business and focus on their own core operations, namely telecommunications and property for First Pacific and wholesale and corporate banking for Chase.

Over the longer term, the main catalyst for consolidation will be diminishing profitability, particularly due to increasing competition. BOC is aggressively increasing its retail banking operations, particularly in the mortgage market, resulting in lower profit margins on this core product. The inability to adapt and expand income sources will force small bank owners to sell to larger banks that can benefit from economies of scale.

Singapore: No catalyst yet

In Singapore, the economic case for industry consolidation is overwhelming. Profitability is poor, banks are overcapitalized and the capacity to increase earnings is limited. The most effective way to improve performance is to consolidate the industry, rationalize branch networks and technology platforms and take capital out of the sector. Meanwhile, the sector concentration is similar to Hong Kong, whereby the top bank is well ahead of its nearest competitor.

Korea: Grouping bad banks together

The government has been trying to kick-start consolidation in the banking sector by placing weak banks under a state-run financial holding company structure, targeted to be launched in 1Q01. We would highlight, however, that such a structure does not reduce the number of banks as the four banks are still allowed to operate as separate entities to minimize staff retrenchment and appease labor unions. We are advocates of this structure as it allows the government to restructure the business operations of the banks under the holding company.

And allowing good banks to merge to become even better

The placement of the weak banks under the holding company structure is also positive news for the good banks because the government will not force them to take over the

12 January 8, 2001

weaker banks, which is good news for foreign strategic investors in both Kookmin and H&CB. In fact, Kookmin and H&CB have already announced that they are merging, which will create a retail banking powerhouse.

Indonesia: Total government intervention

Indonesia had the most unwieldy banking system in Asia, with 239 banks in operation prior to the crisis. The large number of banks in Indonesia put competitive pressure on managers to make riskier loans, which have not paid off. Consequently, 75 have since been closed, leaving 164 banks, which is still too many given the level of economic development in Indonesia as well as the amount of banking assets. The concentration among the top five banks remains high at 56% of deposits.

Even after the closures and rationalizations already orchestrated by IBRA, we believe that consolidation has barely begun. With government entities making no secret of their desire for fewer larger banks, we expect to see minimum capital requirements rise sharply in the next few years, similar to the path taken in the Philippines, whereby the government instituted higher minimum paid-up capital requirement to force the smaller banks to consolidate. This, along with an initially low loan growth environment, will provoke more strategic mergers, with the market eventually making room from 10-15 large banks and a similar number of niche banks.

Thailand: Selling off to foreign players

Consolidation in Thailand has largely been government driven, whereby the government-run Financial Restructuring Agency seized and sold the asset of over 50 finance companies. The government is also in the process of selling off several seized banks, which include Bangkok Metropolitan Bank and Nakorthon Bank. Some of the hurdles include the inability to retrench staff. In Thailand, it is considered poor business practice to lay employees off. Reducing the heavy overhead burden, in our opinion, is one of the many areas the sector critically needs to address, as it would enable the banks to free up some costs to make the necessary provisioning.

Taiwan: Moving at a standstill

There are 52 domestic banks and 41 foreign banks in Taiwan with over 2,400 branches – this is too many for a population of 22 million, which the authorities realize and have been discussing sector consolidation since 1998, with little result. The slow pace of mergers can be attributed to three factors: (i) layoffs which usually accompany mergers are socially unacceptable, especially among state-owned/controlled banks; (ii) the private banks are generally still profitable, which reduces the urgency to merge and (iii) MoF's inability to introduce merger incentives quickly. The authorities only managed finally to offer tax incentives to merging banks in November 2000.

Malaysia: The Iron Hand

Malaysia is embarking on one of the most aggressive consolidation plans in the region, whereby the government has "forced" its 54 financial institutions to merge into ten anchor banks. Most mergers met the December 2000 deadline, but integration problems will prevent merged entities from operating as one.

HONG KONG BANKS

Downgrading Hong Kong after a good run in 2000 We have downgraded the Hong Kong banking sector to Neutral following a an excellent run in 2000. Of the 42 bank stocks in our coverage universe throughout Asia (ex-Japan), only five posted positive share price gains in 2000, and all were in Hong Kong. Following the meltdown of the technology, media and telecommunications sector, investors flocked back to banks and the rest of the old economy. The key drivers for the banking sector were stabilizing asset quality and lower funding costs – both of which are unlikely to drive bank stocks further. Looking ahead, although lower interest rates help support high valuation multiples, further multiple expansion will not be possible without strong top line growth in the form of loan growth and non-interest income growth.

On average, Hong Kong banks in our coverage universe posted a 10% gain in share price in 2000, outperforming the Hang Seng Index by an average of 21%. This performance was even more impressive over the last six months of the year. Over this period, Hong Kong bank shares in our coverage universe increased by an average 30%, outperforming the Hang Seng Index by 37%. As a result, most Hong Kong bank stocks ended the year at or near their twelve month highs.

Figure 5: 12-Month Price Performance

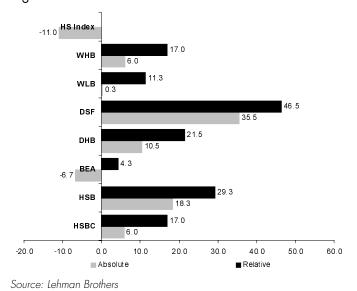

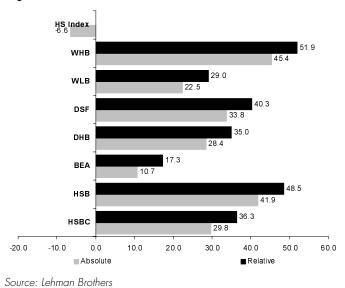

Figure 6: 6-Month Price Performance

Operating environment will be difficult

Looking ahead, we believe that the operating environment will continue to be difficult for banks in Hong Kong. Key concerns are the following:

- 1) Lack of loan growth means top line growth will be difficult to achieve.
- Pressure on net interest margins, particularly from the mortgage war. Lower mortgage yields were offset by lower deposit rates in 2000, but this will not be the case in 2001.

- 3) Investor perception that banks are overcapitalized and destroying shareholder value by not returning excess capital.
- 4) A more aggressive Bank of China, particularly for mortgages and other consumer lending, will result in further pressure on lending spreads.

Earnings due to lower loan loss provisions

Although we have yet to see a resumption of meaningful loan growth, profitability will continue to improve due to lower loan loss provisions, and we project that earnings will increase an average of 28% in 2000. Loss provisions are expected to decline by almost one-half as new NPL accretion has slowed significantly. According to HKMA statistics, the industry-wide NPL ratio declined from a peak of 7.22% in September 1999 to 6.00% at the end of September 2000. Meanwhile, classified loans, which also encompasses NPLs, declined from a peak of 8.99% of total loans to the current level of 7.72%. We expect banks in our coverage universe to report an average NPL ratio of 3.69%, 117 basis points lower than that reported a year earlier at the end of 1999.

Looking beyond provisions, core earnings are expected to decline 4% in 2000. Looking ahead, banks will find it difficult to improve on this result in 2001 if loan growth continues to be weak. Compounding the matter will be pressure on margins and higher spending on technology. To offset the slower lending operations, banks are diversifying into non-interest income, particularly personal wealth management products- large banks are expected to perform better in this area than the small banks, which have limited customer access and products.

Loan growth to remain weak

Hong Kong loans increased at an annual rate of more than 20% per annum in the eight years prior the Asia Financial Crisis, but then collapsed in 1998 and 1999, contracting by 5.2% and 7.4% respectively. 2000 represented more of the same, as banks continued to struggle to lend money- loans outstanding increased modestly by only 2.8% in the first 11 months of 2000 and remained at approximately HK\$2 trillion. Banks are currently very liquid, as the industry loan to deposit ratio has declined significantly over the last two years, from 112% at the end of 1998, to 89% at the end of 1999 to the current level of 73%, and they are eager to lend.

Figure 7: Loan Growth													
	1995A	1996A	1997A	1998A	1999A	2000E	2001E	2002E

Source: Lehman Bro	thers												

The key driver to loan growth in the past was property related lending, which accounted for 68% of loan growth in the 90's. However, this is no longer the case as this source of credit extension has dried up. Property prices remain weak, resulting in smaller average mortgage sizes, the number of property transactions continues to decline as a result of the sharp decline in speculative demand and the lack of investment opportunities have resulted in increased loan prepayments. Away from property-related lending, the prospects for corporate lending will continue to be concentrated among the larger foreign banks. Consequently, we project that industry loan growth will reach 3.2% in 2000 and then continue to be weak at 4.7% in 2001 and 4.8% in 2002.

Mortgage competition

The current mortgage war has raged on for over two years now and sub-Prime mortgages now appear to be a permanent fixture on Hong Kong's landscape. Banks are now quoting mortgage rates are low as Prime less 2.25% over the lock-in period of the first two to three years. At this rate, banks are still making a spread of over 125 basis points over incremental cost s of funds. Therefore, the question remains, how much lower are banks willing to go?

Without a strong pick-up in loan growth, which we are not expecting, we expect mortgage rates will go even lower. By our calculations, at the prevailing mortgage rates of Prime less 225 basis points, banks are generating an ROE of 25% on the minimum capital requirement, based on a 6%- incremental cost of funds and a overhead cost of 50 basis points. Nevertheless, despite all the hype around lower mortgage rates, total mortgages outstanding have remained flat over the last 18 months and re-financing activity is up significantly. This means that banks are simply replacing old mortgages with new ones, but at significantly lower yields, which obviously will have a negative impact on profitability.

Banks have been competing so fiercely for mortgages because they were reluctant to lend to the corporate sector, which was the source of the majority of problem loans, and healthy corporates were unwilling to borrow—and this is not expected to change until at

16 January 8, 2001

least the middle of 2001. Therefore, without an increase in corporate lending as other outlet to channel excess liquidity, banks are likely to continue competing for mortgages.

Surprisingly, HSBC has been quite quiet since its results announcement, at which time management sent a warning to other banks that it would no longer tolerate further shrinkage of its market share in the lucrative mortgage lending market. Over the last 24 months, HSBC's market share in mortgage lending has declined from 40% in mid-1998 to 34% at the end of June 2000. Excluding Hang Seng Bank, which maintained its market share of 16% over this period, Hongkong Bank has seen its market share eroded from 24% to 19%. Hongkong Bank has been losing market share to an aggressive Bank of China Group as well as the smaller local banks. However, HSBC has the ability to price smaller banks out of the market, if it so chooses, as it has a significantly lower cost funding base.

Opportunities in China are still far away for Hong Kong Banks

With limited lending opportunities in Hong Kong, most domestic banks are considering the mainland as a source of loan growth. However, significant obstacles must be overcome before benefits can accrue. Also, most local Hong Kong bank are still wary of this market since it was the source of most of their asset quality problems during the crisis.

China's banking sector is over-crowded, but still needs significant development. There are currently three policy banks (Agricultural Development Bank of China, China Development Bank and Export and Import bank of China which mainly carry out policy-lending function), four state-owned commercial banks (Agricultural Bank of China, Bank of China, China Construction Bank and Industrial and Commercial Bank of China), ten joint stock commercial banks (ownership distributed among State and other investors), 90 city commercial banks, 836 urban credit co-operatives, 41,755 rural credit co-operatives and 177 foreign financial institutions operating in China. The big four state-owned commercial banks account for almost 70% of the aggregate assets of the whole sector in 1999 while foreign financial institutions add up to about 2%.

The China market offers potentially enormous opportunities for both domestic and foreign financial institutions. However opportunities for foreign operators remain limited due to strict regulations. The three most prominent features of the Chinese banking system are 1) the extensive branch networks of the four state banks (over 144,000 branches nationwide), 2) the centrally regulated interest rates on both deposits and loans and 3) the high level of savings. An important feature is the regulated interest rates, which allowed banks to maintain positive lending spreads, which certainly was not the case in other countries, whereby funding costs to exceeded lending rates at the peak of the crisis.

Foreign banks only play a small role in China's banking system. Among the 177 foreign financial institutions in China, less than 30 have received licenses to conduct local currency business in Shanghai area (including Jiangsu and Zhejiang) and Shenzhen area(including Guangdong, Guangxi and Hunan).

Foreign banks are not allowed to source deposits and must fund lending operations through loans from domestic banks. Looking ahead, the government has promised to "fully" open the local currency market within five years of WTO accession. Foreign banks will be allowed to conduct RMB lending to Chinese corporate clients two years after WTO and to Chinese individuals three years later. However, it has been pointed out such full access may still come together with burdensome restrictions, such as branch by branch capital adequacy requirements that will limit the economics for foreign banks.

Of the local listed banks, only Bank of East Asia and HSBC have licenses to conduct Rmb-business. However, these operations are still insignificant, accounting for less than 2% at the former.

Development of Non-interest Income

The lack of loan growth may actually be a blessing in disguise, forcing banks to focus energy on developing non-interest income. In the past, bank earnings were driven by strong asset growth and there was no need to develop other sources of revenue- – non-interest income only accounted for 22% of total income in 1999, well below the 40% exhibited by other developed countries.

However, the operating environment has changed and banks must find other sources of income. To offset the prospect of poor loan growth and possibly narrower margins, banks are concentrating on developing non-interest income, particularly personal wealth management services and we believe that there is tremendous growth potential in this area. In Hong Kong, personal investment usually takes the form of deposits, direct holdings in the equity markets and physical properties. However, given the current sluggishness in both the equity and property markets, investors are actively looking for alternative higher yielding investments such as unit trusts and mutual funds. In addition, as Hong Kong's population ages and becomes more educated, the demand for less risky wealth management products, such as insurance will increase. Under this scenario, we believe large banks are well positioned to capitalize on this growth opportunity because they have strong relationships with their customers, have an extensive distribution network and a wide range of products that can be cross-sold.

Pressure on Net Interest Margins

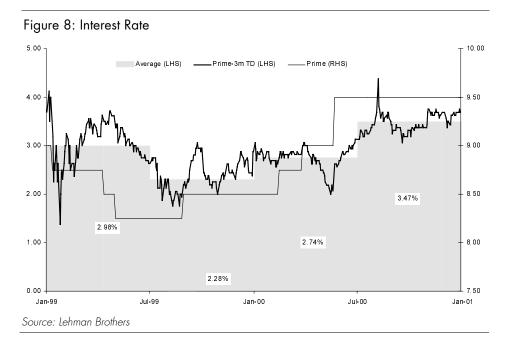

Bank profitability, as measured by net interest margins, is likely to have come under pressure in the second half of 2000 and remain under pressure for the first half of 2001 as the mortgage war takes it toll. We expect NIMs to decline an average of one basis points in the second half of 2000 and then remain at such levels in the first half of 2001.

We have identified the following as being key drivers to bank NIMs:

1) Direction of interest rates: The direction of interest rates alone do not have a significant impact on NIMs. However, the knock-on effect of loan growth allows banks to leverage up their balance sheets and re-deploy funds into higher yielding

18 January 8, 2001

- assets. Unfortunately, we are not expecting any meaningful loan growth any time soon.
- 2) Prime-HIBOR Spread and funding costs: The spread between Prime and three-month time deposit rates increased significantly in 2000 and ended the year at 369 basis points, which is near its two-year peak. This widening spread was brought about by significantly lower funding costs. Current three-month deposit rates are being quoted at the same level as savings deposit rates, generating a deposit spread of 140 basis points, and are not likely to decline further.
- 3) Deposit Rate Deregulation: On July 2, 2001, interest rates on savings and checking accounts are scheduled to be deregulated and banks will be free to offer any rate and compete for these deposits. We do not believe that interest rates offered on savings deposits, which are typically small, are the key determinant to where consumers place deposits. Convenience, bundling of other products and, brand name are more important. Pricing power on these small deposits lies with the banks, and without strong loan demand and excess liquidity in the system, there is no need to compete for deposits. As a result, interest rate deregulation could actually be an opportunity for larger banks that command a large market share of savings and checking accounts.
- 4) Deposit Insurance: The Hong Kong Monetary Authority (HKMA) is considering introducing a deposit insurance that would protect deposits of up to HK\$100,000 at a cost of approximately 10 basis points per year. Deposit insurance will lower the perceived risk for smaller banks and could ultimately result in lower funding costs for smaller banks. This is to the detriment of the larger banks, which currently exhibit lower risk profiles. A mandatory deposit insurance scheme effectively means that depositors at large banks are likely to be subsidizing premiums for smaller banks' depositors who are taking higher risks in return for higher interest rates. Such a scheme will also allow smaller banks to gain market share by aggressively raising their rates, which in turn may encourage the banks to take more risk on the asset side of the balance sheet.
- 5) Lack of lending opportunities: Due to the lack of lending opportunities, banks do not need any more deposits and are offering rates to reflect this desire. Nevertheless, deposits continue to grow at a faster rate than loans. Thus, banks are simply taking in deposits and placing them in the interbank and generating a spread of only 100-150 basis points, which is lower than the average yield on loan assets.

HSBC (HK\$116.00) 3-MARKET PERFORM

We are maintaining our 3-Market Perform rating and share price target of HK\$105. Excluding goodwill and other non-productive capital, return on tangible book value will peak this year at 24.5% and then drop off over the next two years to 23.4% and 2.6% respectively. All three major markets are now experiencing difficulties. Asia earnings are slowing due to lack of loan growth and margin compression. This is particularly evident in Hong Kong where the group continues to lose market share to both Hang Seng Bank and Bank of China. Meanwhile, European operations are experiencing margin compression (particularly from the liability side of the balance sheet) and US operations are expected to report higher and more normalized loan loss provisions.

HSBC has recently announced that it will not proceed with its planned acquisition of Bangkok Metropolitan Bank (BMB) because it could not agree terms with the Thai authorities. Although not officially stated, previous news articles revealed that the two parties could not agree to terms regarding tax liabilities under a loss sharing agreement for bad loans. BMB had Bt100 billion in NPLs at the end of September, equivalent to 80-90% of its loan portfolio. HSBC had been in negotiations with the Thai government since it signed an agreement in principle in May 2000 to acquire a 75%-stake in 177-branch BMB for US\$940 million (Bt36.3 billion).

This transaction is only the latest in a number of high profile deals that HSBC has abandoned. In September 1999, HSBC abandoned its bid for Seoul Bank in Korea and at the end of 2000, HSBC withdrew from the bidding for Banespa in Brazil. In each case, we believe that HSBC formulated strict return requirements, and the prevailing prices would not allow HSBC to meet these strict guidelines.

Despite what management is saying we believe that deposit rate deregulation will be beneficial HSBC continues to say that deposit rate deregulation will hurt margins and plans to offer tiered deposit pricing upon deposit rate deregulation, paying lower rates on smaller accounts and relatively higher rates on accounts with "deeper" relationships. In addition, most banks in Hong Kong are likely to charge fees for bank services such as ATM usage, minimum balance and check writing, among other services.

However, we do not agree with this argument and do not think that interest rate deregulation will have a significant impact on market share. The likely scenario is that interest rates increase, but only marginally. Small banks are currently paying 6% on three-month deposits and are unlikely to pay higher rates on deposits with shorter maturity. Therefore, in a worst case scenario, small banks will offer 6% and large banks will have to offer 5% to maintain market share. Large banks, such as HSBC and Hang Seng Bank offer convenience that small banks can only dream of. Also, with the lack of loan growth, banks are not likely to bid aggressively for deposits. Thus, we believe that HSBC "has to" come out and say that deposit rate deregulation will lead to a rise in the cost of funds so that it can introduce service fees that would otherwise be condemned by the Consumer Council.

HANG SENG BANK (HK\$106.00) 3-MARKET PERFORM

Following a strong 40% share price rise over the last six months, outperforming the Hang Seng Index by almost 50%, we have downgraded our rating on the shares of Hang Seng Bank to 3-Market Perform from 2-Outperform and maintaining our share price target of HK\$105.

Expect both top line growth and bottom line growth through improving efficiency and lower provisions Loan growth is expected to remain strong in the second half of 2000, but will be off the 6.9% pace that was set in the first half of the year. We estimate another 4.2% growth in the second half of the year for a full year figure of 11.4%, the strongest in the sector. Management indicated that loan growth was strong across all sectors. Loan growth could have been even stronger, but management revealed that it had sold some of its PCCW credit in the secondary market to reduce its telecom exposure. This move is not significant given the thin spreads on this loan. Also, the main attraction of this loan was the fees, which are already booked.

Pressure on margins, but volume continues to grow

The NIM is expect to contract in the second half of 2000 from 2.80% to 2.75%. Margin contraction from the mortgage war has been more severe than originally expected. However, the main reason for the margin contraction was the fact that deposits continue to grow, but the bank does not have enough loan demand to absorb the excess liquidity and is placing the extra funds in the interbank market, generating a spread of only 100-150 basis points. HSB's three-month time deposit rates are currently only 4.8%, which is 110 basis points below the current three-month interbank rate of 5.9%. Although margins are narrower, the bank is still generating incremental profit.

Room for cost-to-income ratio to decline further

This bank is among the most efficient in the world and it did not achieve this status by underpaying its staff. Relative to its peers, Hang Seng Bank spends the most on a per staff and a per branch basis. However, Hang Seng Bank is significantly more productive on both a per staff and a per branch basis. The key is information technology and automation.

Development of non-interest income

Going forward, a key area of concentration for management is expansion of the revenue base, particularly the development of wealth management related fee and commission income. Specific focus is being placed on insurance, stock brokerage and unit trust sales — penetration rates of these products are 15%, 15% and 5% respectively, which means there is significant room for growth. Hang Seng Bank will be able to leverage off its strong brand name and relatively wider product range as well as its relationship with HSBC to increase the cross selling ratio to four products per customer within 18-24 months, from the current 2.7x.

Superior capital management and high dividend yield

Finally, the maintenance of a dividend payout policy of 70-80%, resulting in dividend yield of 4-5%, means that management is returning capital to shareholders, rather than sitting on it waiting for an acquisition. Hang Seng Bank has enough capital to fund organic growth and potential acquisitions, and even if it did not, we believe that this bank would be able to easily tap to market.

BANK OF EAST ASIA (HK\$20.95) 2-BUY

We are maintaining our 2-Buy rating on the shares of Bank of East Asia. This bank has been a laggard for most of the year, declining 6.3% in 2000, but is finally catching up, increasing 17% over the last six months. Its shares continue to be cheap relative to Dai Heng Bank, its nearest competitor. BEA trades at both a P/E and P/BV discount, yet will generate a similar ROE and higher earnings growth. BEA has historically commanded a significant premium because of its high exposure to China, which was viewed as an extremely lucrative market. However, higher expected return has also been accompanied by higher risk, in the form of deteriorating asset quality. As a result, we do not believe that BEA will be able to return to pre-crisis levels of valuation and that its higher risk profile has resulted in a lower valuation relative to its peers.

Expect stronger loan growth.

Management expects single digit loan growth in the second half of 2000, with key growth areas being loan syndications and China-related lending. We are projecting 4% loan growth in the second half of the year. Also, management had budgeted for 8-10% loan growth in 2001. Again, the key areas are going to be China-related lending, loan syndications and to a lesser extent mortgages. Rmb-denominated lending has more than tripled over the year, from Rmb900 million at the end of 1999 to Rmb3 billion. Looking ahead, Rmb-denominated lending is expected to account for one-quarter of loan growth in 2001, or Rmb1.8-2.2 billion (based on management's forecast of 8-10% loan growth). Meanwhile, management is budgeting for a 3.5% increase in mortgage lending, (which accounts for 40% of the loan book).

Margins are expected to be maintained

BEA reported a NIM of 2.6% in 1H00 and we expect a similar level for the second half of 2000 and for 2001. Lower yields on mortgages (blended yield on the mortgage book is now Prime less 1.5%) have been offset by higher yields on Rmb-denominated loans, generating a spread of 2.5-3%. With regards to deposit rate deregulation, management's view is similar to ours – that initially rates will increase, but once rationality sets in, due to excess liquidity and lack of loan demand, deposit rates will likely decline.

FPB Acquisition allows for further China expansion.

The biggest reason behind this acquisition was to increase its asset size to over US\$20 bullion, which will allow BEA to open more branches in China. In addition, management indicated that this transaction will increase the bank's catchment area because BEA focuses on the middle to upper market, while FPB focuses on the lower to middle market. In addition, management indicated that it envisions that 35-40% costs savings can be extracted over the next two years. We calculate that management only has to extract 25% costs savings for this transaction to be earnings accretive. Savings will accrue from merging back office operations and IT. FPB's operating efficiency is below average, with a cost-to-income ratio of 50%. Also, BEA has an extensive branch network of 108, which will undoubtedly overlap with FPB's 23 branches.

DAO HENG BANKING GROUP (HK\$45.00) 3-MARKET PERFORM

We are maintaining our 3-Market Perform rating on the shares of Dao Heng Banking Group as we believe that further multiple expansion beyond 2-1/2 x book value will be difficult to achieve given its ROE of only 15-16%. Meanwhile, it is trading at a significant premium to Bank of East Asia, which will exhibit a similar level of ROE and stronger earnings growth.

Weak loan growth

Similar to the rest of the industry, we do not expect DHB to achieve meaningful loan growth in the next 12-18 months. We are projecting loan growth of only 4.8% in FY2001 and 5.1% in FY2002. Meanwhile, management appears to be more optimistic, budgeting for double-digit loan growth. The key areas are expected to be consumer loans and credit card loans, which only account for a combined 10% of the loan book. However, these two areas are the highest yielding assets on the loan book and growth in these areas will help to maintain the net interest margin at 2.6%. Meanwhile, mortgages, the largest component of the loan book at 48%, is only expected to remain at approximately HK\$32 billion. DHB is at the forefront of the mortgage war, offering rates as low as Prime less 2.25% plus HK\$5,000 in legal fees. We estimate that the mortgage book has already re-priced to Prime less 1.5% and will fully re-price to Prime less 2% by the second half of 2001.

Over the last three years, corporate loans have declined by 40% and now account for 42%, compared to 64% at the end of 1997. The decline is likely to come to an end and we are projecting 3% growth in commercial loans as the company is now focusing on small and medium sized enterprises (SMEs). We estimate that the bank currently has approximately 20,000 SMEs. The typical loan to these borrowers is approximately HK\$1 million at a rate of Prime plus 1-2%, which will help stabilize the net interest margin.

Asset quality is no longer a problem and lower loan loss provisions are expected to be the main driver to earnings growth in FY2001. NPLs have already declined by HK\$100 million to HK\$1.6 billion and the NPL ratio has declined 20 basis points to 3.9% and further improvement is expected. We project loan loss provisions to decline approximately HK\$150 million in FY2001 to HK\$216 million and then remain at that level thereafter.

We are still waiting for better capital management initiatives to lower the CAR and improve ROE. Management itself has indicated that their optimal CAR is 13-15%, which is well below the current level of 22%. We calculate that the company could return half of its capital, between HK\$6-7 billion, or HK\$9-10 per share to achieve its optimal CAR of 13-15%. Such a move would almost double ROE. Thus, unless something is done, over capitalization will continue to be a drag on profitability. Management is clearly aware that this is a key concern for investors and we await any new with regards to this concern.

DAH SING FINANCIAL (HK\$45.00) 3-MARKET PERFORM

The shares of Dah Sing Financial have been the strongest performer among Hong Kong banks over the last month, rising over 30%. The key driver is the prospect of lower interest rates, which will have the greatest impact on this bank given the huge 34% fixed rate lending component of its loan book. As interest rates decline, funding costs also decline. However, the yield on its fixed rate loans does not change and profitability improves on this component of the loan book.

DSF has been able to deliver on its promise of loan growth. Since the middle of the year, the loan book has increased by approximately 7% (compared to 0.3% in the first half of the year) or HK\$1.9 billion. The key areas have been consumer loans, particularly re-entry into the mortgage war and high yielding personal and credit card loans. Consequently, we are increasing our loan growth forecast from 5% to 8%, equivalent to approximately an additional HK\$700 million.

We view this loan growth as extremely positive and its ability to achieve loan growth mitigates one of our main concerns since the interim results. In the first half of the year, DSF decided to exit the mortgage war and reduced its mortgage book by 7%. We did not like this move because today's mortgage borrower is tomorrow's buyer of insurance, unit trusts and stock brokerage services. Thus, we welcome the bank's re-entry into the mortgage business. Since the interim results, the mortgage book has already increased by 12% (or 5% YTD). The current mortgage price being offered is Prime less 2.25%, which is still generating a spread of approximately 1%.

Another concern that has been mitigated is the bank's ability to both expand the loan book and maintain its net interest margin. Our understanding is that the bank has been able to maintain the NIM at 3.7%, the same level as that reported in the first half of the year (45bp expansion in the first half of the year). At that time, we were afraid that the bank was sacrificing loan growth to maintain NIM. However, it appears that the bank has been able to achieve both loan growth and maintain the NIM at its industry-leading NIM.

The bank has been able to offset low mortgage pricing by focusing other loan growth in higher yielding personal and credit card loans. These two areas comprise 10% and 7% respectively of its loan book, well above industry average. A key source of loans has been the Internet, which has been generating 15% of unsecured personal loans.

Meanwhile, despite the lack of success of any business model anywhere in the world, DSF is still going ahead with its plan to set up another brand. It is no longer going to be a stand-alone Internet bank, but rather a multi-channel bank that will compete head-to-head with DSF's existing operations. DSF has already invested HK\$29 million and this operation is expected to ready in the first quarter of 2001. DSF plans to use the extra bank license from the Wing On Bank acquisition in 1993 to set up this new bank.

WING LUNG BANK (HK\$31.80) 3-MARKET PERFORM

The shares of Wing Lung Bank were among the worst performing banks in Hong Kong, increasing only 0.3% on the year. However a return to the old economy in the second half of the year helped boost its share price performance to 23%. Despite this strong share price performance in the second half of the year, this stock trades at a steep discount to its peers, yet delivers only a slightly lower ROE. We believe that the discount stems from the company's ultra-conservative management style, which does not appear to be proactive enough to enable it to survive over the longer run.

Conservative management in an ever-changing environment WLB is the most conservative bank in our coverage universe, and with the significant changes that are occurring in the sector, namely increased usage of the Internet as a delivery channel and the deregulation of deposit rates, competition is likely to intensify. Small banks without a concise strategy will find it more difficult to compete against their larger counterparts, which have more resources to invest in technology and have a broader range of products to offer. Smaller banks must find niche strategies if they are to survive in today's environment, which is extremely beneficial to larger banks.

Low NPL figures, but deficient loan loss reserves:

Conservative management has however, led to among the best asset quality in the sector. The NPL ratio is expected to decline to 3.7% and with a general loan loss reserve equivalent to 1.6% of total loans, total reserve coverage of NPLs is expected to exceed 90% by year end-2000.

Our main concern about this bank is its lack of a strategy to develop non-interest income, particularly wealth management related fees and commissions. Non-interest income only accounts for 22% of total income, among the lowest in the sector. We estimate that fee income, which accounts for 45% of non-interest income, will continue to be slow since this bank generates most of its fee income from loan origination.

However, this bank has among the best operating efficiency. Increased usage of automation has allowed this bank to achieve a cost-to-income ratio of 27%, second best in the sector behind only Hang Seng's 25%. Productivity has increased significantly over the last five years. WLB has only expanded its branch network modestly since 1994, increasing from 31 to the current 35. However, total assets have almost doubled, from HK\$32.7 billion to HK\$59.7 billion.

Wing Lung Bank's loan book increased by only 1.2% at the interim and we are only expecting another 1% in the second half of the year. The slow loan growth has resulted in a decline in the loan-to-deposit ratio to 57%, down slightly from 60% at the end of 1999. Overall, net interest income increased by 6% year on year and 2% half on half. Meanwhile, due to the significant liquidity in the system, low cost of funds will continue to offset lower lending yields, particularly on mortgages.

WING HANG BANK (HK\$29.80) 2-BUY

We are maintaining our 2-Buy rating on the shares of Wing Hang Bank. These shares increased 6% in 2000, outperforming the Hang Seng Index by 17%. However the stock performance was significantly better in the second half the year, increasing by 45% and outperforming the Hang Seng Index by 52%. Despite this impressive performance, the shares are still trading at a discount to Dah Sing Financial, Wing Hang's closest comparable.

We expect strong earnings growth on the back of lower loans loss provisions as the NPL ratio is expected to decline slightly to 4.1% by the end of 2000, from 4.4% at the interim. Consequently, we expect the bank to take another HK\$140 million in loan loss provisions in 2H00 for a fully year figure of HK\$320 million, down 27% from the year before. Meanwhile, core, pre-provision earnings are expected to increase by 4-5% in 2000 and 2001 on the back of both loan growth and a better net interest margin.

Loan growth will continue to be slow this year, but is expected to pick up in 2001. Similar to the first half of the year, management is expecting loan growth of approximately 2% in the second half of 2000. The key focus areas are personal lending and credit cards, which account for only 7% of the loan book, but are the highest yielding, generating an average yield of over 20% per annum. Elsewhere, management expects to be able to maintain its mortgage book, which accounts for one-third of its loan book. However, mortgage re-pricing, with new rates between Prime less 2% to 2.25%, is bringing the yield on the mortgage book down by an average of approximately six basis points per month. Currently, the average yield on mortgages is Prime less 40 basis points and the entire mortgage portfolio is expected to re-price by the middle of 2002.

Over the longer run, management is considering the mainland as the bank wants to increase its China exposure and is applying for a Renminbi-license for its branch in Shenzhen. China lending currently accounts for 2% of its loan book or HK\$600 million. The bank is required to have HK\$1.2 billion (US\$150 million) in loan assets before it can apply for a Rmb-license. Management feels that it will be able to achieve this threshold by the middle of 2001. China loans, primarily mortgages, generate a yield of approximately 9%, well above that generated in Hong Kong.

Internet strategy could pay off over the longer term. In addition to the traditional services offered on the Internet, WHB is focusing its Internet strategy on stock brokerage through 50%-owned eZ Finance. This subsidiary will provide a full range of electronic stock-trading services, both on the Internet and mobile phone, including order execution, clearing and settlement and likely share finance arrangements to class "C" brokerages. 25 brokerages have already signed up and the target is for 70-80. Clients of the brokerages will likely open accounts with WHB for easier fund transfer transactions. We believe that this is a good customer acquisition and business generation strategy.

SINGAPOREAN BANKS

Summary

We were Underweight or Neutral on the Singaporean bank sector from May to December, but now see some positive movements under way. Additionally, our fears of a "double dip" recession in the more distressed Asian markets have us seeking shelter in Singapore's relatively well-capitalized and high quality banks. Accordingly, we rate the sector as an OVERWEIGHT, with the following rationale.

Key Investment Factors

- ROEs Must Clear the Hurdle: Investor patience with the Singaporean banks is waning. While core ROE has improved from an average 4.2% in 1998 to 10.1% in 1999 and an estimated 12.2% for 2000, this level still badly lags that posted by banks in other non-distressed markets, such as Hong Kong. Capital is too high at every bank in the country, and loan growth generally too low. With little potential for ROE-accretive acquisitions in the region, banks must return capital to shareholders, and the sooner the better.
- Loan Growth Lags GDP, but is Improving: Over the past year, Singapore's GDP has grown at blistering rates sometimes approaching double digits—but loan growth has remained flat as a pancake despite the best efforts of bankers and a stellar performance by the consumer lending segment. Although still slack, lending has begun to pick up overall, with year-on-year growth now estimated at 4.1% and recent monthly figures showing strength. Given Singaporean banks' extremely underleveraged balance sheets and poor ROEs, low growth has justifiably kept a lid on share price appreciation.
- We note that growth in the key consumer lending sector has been strong all year and continues to advance, rising at double-digit rates in the most recent monthly reports. Consumer income is rising swiftly, which will help maintain this aggressive growth. Banks such as UOB, OUB, and DBS with substantial consumer exposure will benefit from this trend.
- Favorable Interest Rate Policy: A U.S. interest rate loosening will benefit Asia's large interest sensitive bank stocks. We see this as a positive only for Singapore within SE Asia, as other countries have margin structures which are still driven strictly by internal liquidity and excess NPLs.
- Strong Balance Sheets: Singapore's banks are by and large well-positioned with regard to asset quality and balance sheet strength. The overstuffed capital bases which hinder ROE offer a large (and, we believe, unnecessary) cushion against losses. Furthermore, all banks are well-reserved against residual NPLs, and have curbed their non-Singaporean lending, from whence most NPLs came.
- Restructuring Potential: We expect that capital management and rationalization, long a bugaboo of these banks, will finally be addressed in 1Q01. In particular, OCBC

and OUB have substantial non-core assets which are undervalued and produce minimal return. Sales of these assets (already mandated by the MAS) will produce gains and higher income as funds are redirected into higher-yielding assets or returned to shareholders.

- Fee Income Generation: Given the high levels of capital held at the banks, in part driven by the MAS' over-conservative 12% CAR requirement, pure deposit-taking and lending—at least in Singapore—will not be enough to generate acceptable ROE for the bank sector. The winners will be those banks which are able to use this core business as a base upon which to build fee-generating businesses such as asset management and insurance. An early leader in this field is UOB, which leads Singapore in assets under management and already generates close to 8% of non-interest income from fund management fees.
- Consolidation: While we no longer predict that Singapore will have only two domestic banks any time in the near future, domestic consolidation continues to make compelling economic sense in this compact and mature market. The most sensible potential transaction remains an OCBC-OUB tie-up of some sort. While OCBC is still the most likely acquiror, investors have grown somewhat impatient with the slow rate of change at OCBC, and this could lead to a credible bid for the bank by OUB, possibly with a foreign partner. Keppel and UOB would also make a complementary pair; however, KTLB's AIB and Keppel Corp. ownership stakes will give management ample ability to resist being acquired.

Investment Opinion

Specific Recommendations in the Sector

We continue to be less positive on prospects for the larger banks given their recent underperformance in generating loan growth. In line with our regional view on the importance of the emerging consumer lending sector, we favor banks such as UOB with demonstrated ability to garner assets and fees in this area of the business. Additionally, we believe that restructuring and potential consolidation will produce benefits for OUB, OCBC, and UOB. Brief comments:

- UOB (Top Pick): The key drivers of our view on UOB continue to be superior in growth and higher ROE, both currently and prospectively. At 13% for the most recent period, UOB's core ROE is still materially outpacing that of its domestic competitors. The bank reported customer loan growth of 6.7% year on year for the first half (5.0% half on half), well above the industry average. Not only is UOB taking share from its domestic competitors (mainly DBS and OCBC), the bank is squarely positioned in the highest-margin business segments: SMEs and consumer lending. Finally, UOB's leadership in asset management will help cement its client relationships and increase cross-sell potential, further improving earnings. 1-Strong Buy.
- OUB: OUB has been executing well, but remains primarily a takeover and restructuring play due to its fundamentally weaker franchise. We believe that an inmarket acquisitor could pay a substantial premium for OUB while still maintaining earnings accretion due to the large potential for cost savings. In addition, rationalization of the OUB/OUE stake-holdings would boost earnings and special gains while potentially reducing shares outstanding. 2-Buy.
- Keppel TatLee: KTLB is clearly a value play, currently selling below book value despite its faster-than-average growth. However, the bank is limited in its ability to grow in Singapore and Malaysia, and so will be hard pressed to increase its leverage without share buy-backs. The government's controlling stake in KTLB (through Keppel Corp. and Temasek) means that shareholders are unlikely to be able to realize value through a merger, despite the attractive nature of the bank's franchise. 2-Buy.
- DBS: While DBS has been a share loser in recent periods, and has squandered shareholder funds in an ill-fated (to-date) regional diversification, the bank remains the largest consumer lender in Singapore, and is well positioned to benefit from the effects of higher spending and borrowing. Additionally, as the largest mortgage lender, DBS should be lifted by an apparent end to the mortgage price war. 2-Buy.
- OCBC: OCBC has been beset by troubles in its core Singaporean lending business, as the bank has lost share due to a weak product line-up and shaky IT. Instead, management has poured its efforts into establishing two new standalone Internet banks (one in partnership with ANZ). We believe that this strategy is fundamentally flawed and will increase minimum capital needs without generating positive returns.

While OCBC does have upside potential due to its sub-optimal capital structure and large holdings of non-core assets, we believe that the assessment of these assets and the anticipated gains (already included in capital in our models at appraised value) is already in OCBC's valuation. 3-Market Perform.

Sector Discussion

Excess Capital Continues to be a Drag on Shareholder Returns

Banks in Singapore continued to pile up capital last year, with equity to assets at year-end standing at an average of 13.5%, up from 12.4% in 1998. BIS capital adequacy ratios reached 20.3% on average, contributing to an average core return on equity for the sector of only 11.85%.

With MAS promoting the consolidation theme throughout the year, managements have been fortifying their positions by retaining capital far beyond what is necessary for foreseeable operating needs, either in hopes of building a war chest to make acquisitions or as a defensive measure to make a takeover of their institution prohibitively expensive. Now that central banking authorities have backed away from the forced consolidation theme, we expect the capital trend to run the other way, as managements realize that the only certain route to oblivion and inviability going forward will be a single-digit core ROE in a peak year.

Acquisitions Have Yet to Add Value

As Singaporean banks have attempted to deploy excess capital in other markets, we have seen a wave of foreign acquisitions: Kwong On (DBS), Thai Danu (DBS), Radanasin (UOB), Westmont (UOB), and BPI (DBS), as well as abortive Keppel TatLee acquisitions of stakes in Siam City Bank and Equitable PCI Bank. What we have yet to see are significant returns from these outlays, with DBS in particular being an egregious offender. Management teams who wish to avoid forced consolidation may instead be tempted to grow by acquisition in order to gain scale at the expense of returns, a very real risk for investors.

Asset Quality Has Bottomed Out

FY1999 was the last year of extraordinary provisions for banks in Singapore, with average provisions falling by 33% for the full year. At this stage, only DBS and OUB are under-reserved by our (conservative) methodology, with the other banks comfortably above our threshold for full coverage of portfolio losses. We expect that DBS' sale of Thai Danu loans after the end of 1H00 and OUB's steady progress in reducing NPLs will bring them up above 100% of our desired level by year-end.

NPLs have peaked at below 10% of loans, ending 1H00 at 8.9% of total loans. We project a fairly rapid drop-off to 8.0% in FY2000 and 6.3% in FY2001, with interim charge-offs falling to an equilibrium level of 0.5% per annum.

Internet Increases Risk of the Status Quo

As one of the most highly "wired" countries in the world, Singapore is on the leading edge of the Internet's impact on traditional businesses. While Singaporean bank managements in general appreciate the magnitude of the change that is upon them, many are choosing to address this change through proprietary portal strategies and through the liability-led customer acquisition drives that have failed in other markets. We believe that the way forward lies with the type of asset-focused customer strategy typified by KTLB.

While rising FY2000 earnings at the Singaporean banks are basically assured by falling loan loss provisions and very strong fee income gains, we expect loan growth to be a differentiating factor between winners and losers in FY2001 and beyond. With a surfeit of capital at every institution, and consolidation seemingly stalled for the time being, the five remaining banks are dependent upon stronger asset growth in order to leverage their balance sheets and post respectable ROEs.

With the Singaporean economy running essentially flat-out but loan growth expected to end the year up a meager 3.4%, Singapore has experienced one of the longest instances of GDP/loan growth de-linking we can recall. However, there are several bright spots in the overall gloom: Consumer lending has been increasingly strong, with YTD growth (through November) of 13.7%. Mortgage lending has improved, mitigating the effects of rate competition, with banks as a class have been taking mortgage and other consumer business away from the remaining non-bank finance companies.

Loans to manufacturing companies continue to fall. With substantial excess capacity and utilization still well below its pre-crisis level, manufacturing loan demand is only strong in the working capital segment, and not for plant and equipment financing.

Asset Management Adds a New Dimension

New data from the MAS and other sources have shown that the Singaporean unit trust market—a key factor in expanding bank asset management operations—is continuing to expand, rising by 4% quarter on quarter in 3Q00 despite losses from a slumping stock market. The overall Singaporean unit trust market has grown at a CAGR of 39% since 1997, albeit from a low base, and now totals S\$8.9 billion. For several structural reasons, we expect this inflow of money to continue, with growth moderating only slightly to a CAGR of 31% over the 2001-2005 period. First among these is the beneficial effect of the mandatory CPF scheme, which by itself will directly account for a substantial amount of the growth.

The CPF also has the effect of raising investors' comfort level with unit trusts in general, which may induce them to invest outside the CPF. With a relatively high concentration of affluent investors, Singapore has ample capacity to further increase its consumption of asset management products.

On the institutional side, Singapore's government has made a concerted effort to attract international money management firms, with a fairly impressive amount of early success. While banks such as OUB and DBS have substantial institutional management arms, it bears keeping in mind that this sector is considerably less profitable than the high-margin unit trust business, where sales charges of 4% are still common, although fierce competition means that their day is swiftly fading.

Singapore's banks are well positioned in both the retail and institutional asset management markets, with some important distinctions within the sector. UOB and OUB lead in total assets under management, both narrowly ahead of DBS, but with very different profiles. UOB is a retail powerhouse, offering some 26 different funds through its powerful consumer banking franchise, OUB has concentrated heavily on the institutional side of the market. While DBS runs a close third in total AUM, the bank

contracts partners such as Frank Russell to manage many of the portfolios, giving up a share of revenues.

Figure 12: Singaporean Bank Assets Under Management											
S\$, MM	Total AUM	Retail	Institutional								
UOB	4,000	1,600	2,400								
OUB	3,800	200	3,600

Asset management revenues account for a material and rising percentage of Singapore bank non-interest income, with aggregate revenue increasing at a 200%+ annual rate over the past six quarters. Currently, we estimate that UOB and OUB derive the greatest percentage of their NII from asset management—a factor we feel is frequently overlooked when valuing these franchises as the entire business is off-balance-sheet and poor disclosure hampers an accurate evaluation of revenues.

The Mortgage War Spreads to Singapore

All five banks cut their mortgage rates substantially in the fourth quarter, led by OUB and UOB. Although cutting rates in the absence of incremental loan growth is unequivocally a negative-sum game, it does not seem out of the realm of possibility that banks may be able to stimulate some additional borrowing, particularly given the US rate cuts.

Any of the banks that can effectively use lower rates to increase share and balances will benefit from the interest rate war; we expect DBS to be the biggest loser due to its dominant current market share and Keppel Tatlee and OUB to continue as relative outperformers in mortgage lending.

Source: Company reports; Dollardex.com

Given the surplus capital and general liquidity of the sector, we believe that rates could fall considerably further without removing the profitability of mortgages. In our analysis, we assume that banks fund additional mortgages by either borrowing in the interbank market or by removing their own invested funds from interbank borrowers.

Using the statutory 12% risk-based capital requirement and 50% residential mortgage weighting, we have included a 6% capital charge in our base break-even analysis, which assumes a generous 15% cost of capital. We have also included 25 basis point charges for servicing and bad debt costs.

The resulting funding cost of 3.57% for mortgages is above some banks' first and second year teaser rates, but is well below the average yield of 4.91% on mortgages assuming that they maintain a seven-year average life. This indicates that banks could drop rates by an additional 130+ basis points over the course of the loan without losing money.

Even assuming that refinancings occasioned by the low rate environment reduce the average life to five years (an extreme case given that almost all of these mortgages carry prepayment penalties), the average yield would drop to only 4.64%, leaving 107 basis points between funding cost and asset yield.

However, with all of the banks severely overcapitalized, it is far from clear that they should (or will) be pricing in the full cost of capital, as it is not a near-term constraint. Using only the marginal cost of mortgage funding, without charging for capital, yields an average mortgage funding cost of only 2.81%, below even the lowest teaser rates.

Non-Core Asset Divestments Will Yield Better Banks

After years of hopeful waiting, investors will finally be able to hold "pure play" Singaporean banks in the near future, without being forced to subsidize property or holding company investments. The MAS announced new regulations during the second half which will limit its supervised banks' ability to hold non-financial assets and businesses within their corporate structures. The measures are intended to limit the banking system's exposure to losses at unrelated companies and enhance transparency,

both of which aims we loudly applaud. Effects will be most significantly felt at OCBC, which holds the greatest proportion of unrelated businesses. We see this move as a positive for the sector and particularly for OCBC.

- Regulatory Effects: Over the next three years (although we expect effectively full compliance by year-end 2001), Singaporean banks must segregate financial and non-financial assets into different holding companies, and divest the non-financial assets either through direct sales or via spin-offs to shareholders. The regulations do contemplate banks keeping certain non-financial businesses which have "clear synergies" with the banks' core businesses. We believe that this will include most Internet and e-commerce ventures; however, it appears to exclude most investment real estate.
- No Keiretsu Structures: Cross-shareholdings between the financial and non-financial arms of the current banking groups will be prohibited. In addition, managements (including a majority of each Board of Directors) must be separate and independent. Non-financial companies will not be permitted to use the banks' logos, or even to share names (viz. DBS Land) which may imply connections with the banking groups.
- Possible Tax Benefits: In order to minimize any tax effects from the sale of these businesses, the government has agreed to an unspecified set of one-time rules for these transactions which we believe will shelter most gains on sale.

OCBC: OCBC has the largest proportion of non-financial assets, including stakes in Fraser & Neave Ltd. (12.5%), Robinson and Company (21.1%), and the Straits Trading Company (16.1%). In addition, the bank holds large amounts of investment real estate, with property revaluation accounting for over \$\$3.1 billion of the bank's capital. As these assets have had little synergy with the bank, we are pleased to see them go so that capital can be rationalized.

DBS: DBS has already divested many of its non-core assets, including property and most of its stake in DBS Land. The company reports that the MAS directive will affect listed investments (including stakes in NatSteel, Intraco and CWT Distribution) with market value of \$\$170 million and unlisted investments with NAV of \$\$65 million at last reporting period.

UOB: UOB will have to divest its holdings in United Overseas Land (44.9%) and Haw Par Corp. (43.4%). The bank reports that no investment property will need to be sold.

OUB: OUB will need to sell or distribute its holdings in hospitality firms Overseas Union Enterprise (49.4%) and Hotel Negara Ltd. (53.4%). The bank reports that no investment property will need to be sold.

Keppel Tatlee: After the divestiture of KTLB's 49% stake in TLB Land during FY1999, the company has no non-core assets which will need to be sold under the new regulations.

DBS BANK (S\$19.80) 2-BUY

Investment Summary

As the largest consumer and corporate bank in Singapore, and one of the largest asset managers, DBS will be a major beneficiary of a rebound in the sector. Down over 28% in 2000, DBS has been punished by investors (and by us) for poor regional diversification and shrinking loan share, even as the bank has failed to generate appropriate ROEs. However, we believe that several factors now stand in favor of DBS, and accordingly lifted our rating to 2-Buy from 3-Market Perform in late December, with a new price target of S\$22.75.

Having reached the end of its recovery from the Asian Crisis, DBS needs to generate growth in its home market and returns from its expensive regional strategy in order to be able to post returns. While Thai Danu should be a drag on earnings no longer, the bank has yet to make any significant contribution. Ditto for DBS' investments in Hong Kong, the Philippines and Indonesia.

Key Points

- Interest Rate Cuts Will Benefit Growth and Margins: DBS has exposure to what are now reasonably clean franchises in Singapore, Hong Kong, Thailand, and the Philippines—all of which have been suffering from compressed margins. We expect lower rates to spur growth in outstandings and margins.
- "Thailand Discount" Lessens: DBS has additional upside due to the removal of DTDB as a major drag on consolidated margins. We expect that lower foregone interest income alone at DTDB will add 3–5 basis points of net interest margin to the group by the end of FY2001.
- Retail Share Still Strong: DBS remains the largest consumer lender in Singapore, although its proportional exposure lags behind that of UOB and Keppel TatLee. However, the bank is well positioned to benefit from the effects of higher spending and borrowing, Additionally, as the largest mortgage lender, DBS should be lifted by an apparent end to the mortgage price war.
- Asset Management Adds Return: DBS has added S\$1 billion this year in retail AUM through its Horizon and Eight unit trust products; there appears to be substantial headroom to increase this figure. A recent conversation with management revealed that DBS currently has over 3,000 retail customers with current account balances in excess of S\$1 million—prime candidates for conversion into mutual fund customers.

This conversion will move balances from low margin spread-based balance sheet accounts which require capital backing to off-balance-sheet, fee-based relationships which produce higher income without capital requirements, boosting profits and ROE.

Management is Unmatched: We believe that DBS management is perhaps the most impressive among those of the regional banks. As investors seek shelter from a

potential economic downturn elsewhere in Asia, we believe that they will continue to attach a premium to DBS due to its management strength, transparency, and disclosure.

Still an Expensive Franchise: While we believe that DBS will be able to reap rewards by using its premier market position and regional scope, we believe that the bank's premium to the rest of the sector is unwarranted given its sub-par ROEs. We believe that investors should be focused around the value names in the sector during early 2001.

Strategy: Acquisitions are Planned; Investors are Skeptical

Size Matters

The centerpiece of the DBS strategy continues to be adding scale. This includes not only bulking up the balance sheet and capital account to facilitate eventual moves into North Asia, but gaining a diversity of business streams from more developed markets in order to smooth earnings. Once this is accomplished, management feels that the bank will be able to expand its presence in more severely distressed markets without a negative reaction from investors, as emerging risks will then represent a much smaller portion of the overall institution.

Developed Market Acquisition Focus In order to gain size and stable earnings, DBS is focusing on Hong Kong and Australia. The Hong Kong market is considered particularly attractive by management due to the perception that customers are underserved in key segments including unit trusts. Any Hong Kong acquisition would be merged into Kwong On Bank (which is gradually being re-branded with the DBS name), and would not keep a separate listing.

Developing Markets No Longer A Priority While DBS has made small-scale moves, such as boosting its stake in DBS Bank Indonesia (the former TatLee Buana joint venture bank), management indicated that further expansion in Indonesia and Thailand is not a priority—at least in part due to the expectation that investors would react negatively to any additional capital commitments in these countries.

BPI Stake Slow To Add Value

We remain negative on DBS' S\$1.2 billion investment in Bank of the Philippine Islands, although we do think that BPI is the best franchise in the country. DBS has invested S\$1.2 billion in a ~20% stake—far above the current market price. In return, DBS gains access to the bank's distribution channels, primarily for bancassurance and unit trusts.

DBS plans to link its ATMs in Singapore, Hong Kong, and potentially Thailand with BPI's network within a year. Among other things, this will enable Filipino overseas workers to remit money ATM to ATM, without necessarily having to maintain multiple accounts. While this is an innovative entry in a historically lucrative market segment, it is difficult to see initiatives of this type ever producing a market return on the aggregate DBS investment.

Loan Growth and Margins: A Game of Inches

DBS was not able to capitalize on its market power to boost the loan book during the first half of 2000, with total customer loans down 3.5% in the half versus our projection of 1.5% growth. With no top line growth, margins continued to be constrained, rising to 2.21% from 2.16% in 2H99, but below the 2.23% recorded in 1H99.

Management can rightly point to increasing margins as evidence of execution in its core business; however, we note that much of the increased margin by our calculations comes from lower foregone interest income on NPLs as problem assets decline. While this is of course commendable, it is less positive than an operating margin expansion. In any case, DBS promises to continue expanding margins by exiting unprofitable business areas and applying a strict 15% ROE hurdle for lending. As for the recent mortgage war outbreak, CFO Jackson Tai says that management is "repulsed by price competition."

Asset Quality is No Longer a Driver

Asset quality improved during the half as expected. DBS has now completely escaped the legacy of the Asian crisis, and is fully provided against loan losses post the Thai Danu NPL sale transaction. NPLs dropped from an estimated 9.8% of total loans to 9.4% of total loans during the period, slightly above our projection of 9.1%. Reserves cover 49% of NPLs; DBS reports that collateral covers 55% of gross NPLs.

Thai Danu NPL Sale: Subsequent to the close of the half, DBS' Thai unit Thai Danu Bank sold Bt30.6 billion face value (\$\$1.3 billion) in NPLs to a consortium led by Lehman Brothers and National Finance and Securities PCL for Bt8.4 billion (\$\$356 million), a haircut of approximately 73%. We estimate that this transaction has caused total consolidated NPLs at DBS to fall by 23% (to 7.2% of total loans), and that the loan loss reserve is now fully adequate.

We believe that the difference between book and sale value at TDB, approximately S\$1 billion, was absorbed by reserves both at the TDB and DBS level, resulting in no consolidated P&L impact. We have assumed, based on John Olds' statement that the majority of the TDB loans sold were "toxic," that all Bt30.6 billion in NPL reduction came from TDB's well-stocked Loss loan category.

OVERSEA-CHINESE BANKING CORP. (\$\$13.00) 3-MARKET PERFORM

Investment Summary

OCBC, once our favorite Singaporean bank, has fallen on hard times of late due mainly to poor execution in its home market and a confused strategy which relies heavily on technology investments. The bank is still operating in a challenging environment, and will likely continue lag its regional and Singaporean peers in performance. However, as OCBC is the Singaporean bank most dependent on pure interest spread (as opposed to fee income) for its profits, a rise in growth or margins on the bank of the Fed's easing trend will be a most welcome boost.

While other recent developments, including the appointment of a well-regarded new CFO from National Australia Bank and the upcoming release of the bank's capital restructuring plan, appear positive, we still rate OCBC only as a 3-Market Perform pending concrete execution.

Key Points

- Loan Share Continues to Slide: Customer loan growth has been negative at OCBC over the prior period as the bank has lost share in a marginally-expanding market. Management hopes to end the year with a flat loan book, which would imply 2-3% customer loan growth in 2H00 in the SGD book, with the non-SGD book (some 25% of the portfolio) still declining. Both commercial and housing loans have begun to recover for the bank, although most other sectors are still stagnant or worse.
- Asset Quality Weakened, But is Back on Track: NPLs, which had begun to rise again in 1H00, are once again dropping, with the peak having occurred in March. These NPLs, unlike the regional portfolio which caused the initial 1998-99 rise, are mainly Singaporean and Malaysian. Management commented that the Malaysian NPL book had become unexpectedly difficult to cure; we may see this impact other Singaporean banks with significant Malaysia operations such as UOB and OUB.

NPLs had risen from 9.2% at year-end 1999 to 9.7% at 1H00; we now forecast that they will fall to 9.0% at year-end 2000—a gross amount of approximately \$\$4.3 billion. OCBC's current reserves of \$\$2.46 billion are more than adequate to cover known and potential losses in the portfolio. In fact, we calculate a reserve surplus in excess of \$\$500 million, which will allow for potential write-backs in coming years.

Restructuring Plans Will Drive Returns: OCBC's plan for divesting its non-core assets, along with its matching capital rationalization plans, will set the tone for investor perceptions of the bank over the next few years. We expect to see a comprehensive plan by the year-end earnings announcement in late 1Q01, and will be looking for substantial return of capital to shareholders.

Strategy: How Best To Use Excess Capital?

OCBC is Acquisition-minded

The bank has recently reaffirmed its desire to use its substantial excess capital position, along with prospective gains from the sale of real estate and other non-core assets, to make acquisitions. We see this as a bad plan for shareholders, and would much prefer a significant return of capital, which we calculate could total over \$\$5 billion.

With the exception of an in-market merger (most likely to be OUB), we are likely to be extremely negative on any announced transaction, with the following rationale:

- Price: The banks at which OCBC has been reportedly looking, including Dao Heng and IBA (OCBC was also reportedly a suitor of FPB Bank Holdings before its sale to Bank of East Asia), are either already fully priced or would likely be so after adding acquisition premium. Any deals done at these prices will be dilutive to OCBC's already poor returns.
- Synergy: The synergy between OCBC and a small or medium-sized Hong Kong bank would be minimal, as the positioning, clientele, and products offered are fairly different and will remain so for structural reasons. Cost saves given the widely separated markets will be limited, and therefore the market premium which would be necessary to pry one of the Hong Kong banks away from its controlling shareholders is not warranted. Ditto for Taiwan, the Philippines, Thailand and the other acquisition markets du jour.

The only market where potential synergies exist is Malaysia, where OCBC already has a substantial presence. However, OCBCM is virtually at its limit for branch expansion, and OCBC will not be permitted to buy a local Malaysian bank before 2003 at the earliest.

Management: OCBC has failed to execute its own operating plan in Singapore. The bank has been consistently losing market share, its e-banking strategy can be charitably described as confusedly optimistic (and the bank's internal IT is reportedly chaotic), and management's dilatory attitude towards returning capital to its owners is baffling. We find it hard to see any benefit which would accrue to an acquired institution from OCBC's management supervision.

Investors would seem to be better off using returned capital to assemble their own portfolios of non-Singaporean banks, rather than paying OCBC to do it for them at a premium.

Will the Tables be Turned?

Given that OCBC's strategy appears to be adrift, and the poor performance of its shares, it may well be time for shareholders to explore selling the bank to someone who would be able to extract more value from its operations. Is Singapore's first hostile bank tender on the horizon?

Lending Strategy

Mortgage War: Management confirmed that, as in Hong Kong, the mortgage war is depressing spreads without spurring the overall market. OCBC sees no incremental growth in mortgage loans, but continues to be very competitive in this area of the consumer market, albeit at a high cost.

New Products: OCBC introduced other new consumer lending products this fall, including auto loans and unsecured personal credit. It is a measure of how slow the bank has been to exploit this critical sector that neither product has previously been available from the bank. Management reports that auto finance take-up has been disappointing; despite low rates it may be that the bank's decision not to tie up with dealership partners has cost it business.

The unsecured credit product has just been introduced, so no performance data are yet available. The bank has launched the loans with a promotional rate of 6.5% through June 2001, after which the rate will be 14.8%. This compares quite favorably with existing rates at other banks, currently 11–16%.

Internet Banking Standalone
Plans are Questionable

OCBC has instituted two standalone net-bank ventures one with 50% partner ANZ, and the wholly-owned finatiQ, which operates through the group's Bank of Singapore (BOS) subsidiary.

While OCBC management makes a good case for the differing strategies of OCBC/ANZ and finatiQ, we feel that both pure net banks fail to exploit the group's existing brand, branch networks and customer data. In our opinion, OCBC will be hard pressed to establish two regional net-bank brands and operations simultaneously.

The joint venture e-bank will focus on affluent Asian consumers, but will be launched outside OCBC/ANZ's home markets of Singapore, Australia and New Zealand, although it will be accessible to consumers in all countries. While management is not yet willing to disclose the bank's target launch markets, the Boom.com tie-up and OCBC's historic strength in China would indicate a Hong Kong/China focus, while previous conversations with management have illustrated their belief that Korea and India will also be major e-banking markets.

OCBC management see the OCBC/ANZ net-bank as offering a wider range of banking services than will finatiQ, with all products originated through the bank itself or its partners. The new venture will also offer shopping, entertainment, and travel lifestyle services—the model for these would seem to be UK net-bank Egg. In contrast, finatiQ will remain primarily an aggregator of other financial institutions' products, with a more independent and non-traditional customer base.

Until now, finatiQ has focused its marketing in Singapore; this will have to change if the effort is to have a reasonable chance of profitability. We believe that finatiQ is looking to expand in many of the same markets as will its younger sibling, so that direct

competition is a virtual certainty. We agree with OCBC that the Internet space is large enough for many players; however, the group appears to be slighting the needs of its core banking business in favor of a diffuse program of investments, partnerships, and new ventures.

We continue to feel that pure net-banks will find it hard going when competing against integrated institutions which offer customers Internet, phone, branch, and ATM channels. If we're wrong, then why isn't OCBC moving its entire consumer business into the Web channel, as OUB has considered? Either this is too much ado about nothing, or it's not enough.

LEHMAN BROTHERS 53

OVERSEAS UNION BANK (\$\$8.00) 2-BUY

Investment Summary

While OUB remains a fundamentally weaker franchise than our favored banks in Singapore, management has managed to drum up sector-beating loan growth while maintaining credit quality. Additionally, we believe that OUB is the best way for investors to gain from restructuring of the bank sector, as OUB's structure is particularly susceptible to a positive transaction. Finally, OUB's price has a floor due to its status as a takeover target. We believe that an in-market acquiror could pay a substantial premium while still completing an earnings-accretive transaction.

Due to these factors, we rate OUB as a 2-Buy, and our favorite in the sector after UOB.

Key Points

- Loan Growth: OUB showed total loan growth of 18.7% half-over-half in 1H00, although loans were still essentially flat from a year ago. However, the key statistic of customer loans rose 5.2% year-on-year, well above the industry average. OUB is taking share particularly in the prime sectors of housing loans (+51% year on year) and consumer lending (+18% year on year). With all of the Singaporean banks underleveraged, we expect that the ability to book high margin assets will prove to be the differentiating factor in profitability going forward.
- Rates and Margins: Net interest margin increased by 17 basis points to 2.45% in the half, and is 32 basis points over the mark recorded in the comparable period of 1999. NIM expanded on a large increase in yield on earning assets of 16 b.p. during the year, against an increase of only 4 b.p. in the bank's cost of interest-bearing liabilities. NIM is also expanding faster than interest spread, as loan growth has made the mix of assets more favorable.
- Divestiture of Associated Companies: In our last conversation with CEO Peter Seah, he presented a compelling rationale for attributing value to the bank's pending disposal of unrelated investments. OUB's investments in listed associates alone are on the books at \$\$586 million, and we believe that they could be worth up to \$\$1 billion if properly disposed of. These assets currently produce little return for the bank, particularly when the cost of capital is factored in.

If this value can be unlocked (even if it is only invested in securities or interbank placements), OUB stands to realize not only a windfall gain on any market value increase, but a continuing source of incremental earnings. Note, however, that any sale revenue realized in excess of the current book value would increase OUB's already excessive capital, potentially further stifling the group's ROE (note that we already calculate our ROEs for all banks including revaluations where discernable so as to account for the true economic return on capital).

We note with interest, however, that primary associate Overseas Union Enterprises (OUE, S\$4.66, Not Rated), 44.62%-owned by OUB, in turn holds a 9.37% stake in OUB. This stake is worth some S\$665 million at current prices, 81% of OUE's trading market value of S\$822 million. Given OUE's numerous stakes in properties and hotels, it seems likely that the company would be worth significantly more if divorced from the bank group completely.

In order to accomplish this, OUB could conceivably sell its OUE shares back to the company in return for OUE's stake in OUB, thus at once raising the value of its investment, freeing up funds for investment at higher rates, and buying back shares to increase leverage and ROE. We consider this a very positive potential development.

- Malaysia: OUB has long had a presence in Malaysia, through wholly-owned subsidiary OUB (Malaysia) Berhad ("OUBM"). However, the bank has heretofore conducted an exclusively commercial and wholesale business. OUBM now plans to expand its franchise into the consumer market, and towards that end has embarked on a rebranding campaign for its branch network. In addition, the merger of OUB Finance (Malaysia) Bhd into the bank at year-end 1998 has allowed OUBM to obtain approval to relocate some of its branches to more desirable areas, which should pay off in expanded business by FY2001. With Malaysian loan growth outpacing Singapore's, this could be an excellent way for OUB to deploy funds freed up by asset divestiture.
- Acquisitions: President Seah indicated that OUB will not be making any richly-priced foreign acquisitions in order to sop up excess capital, but will focus on Internet banking to penetrate other Asian markets. Naturally, he did not rule out making regional acquisitions at reasonable prices, but was fairly dismissive of the acquisitions made by Singaporean banks so far. That's our view as well, so we felt warm and validated.
- Internet Banking: It had been a source of consternation to us that OUB, which we viewed as the only bank to appreciate early the magnitude of change the Internet is bringing to financial services, had been moving quickly in what we believe to be the wrong direction, via a standalone JV with European e-bank first-e. However, given first-e's troubles in its own market, the JV is on what we suspect is permanent hold.

We wondered why OUB had elected to create a new subsidiary to engage in these operations, given management's view that they are integral to the future of banking in Asia, rather than choosing to re-make the existing bank with a robust Internet channel (OUB already has the most effective net presence among the Singaporean banks). Mr. Seah explained that he felt OUB was not capable of implementing the radical changes needed to grasp the Internet as quickly as a smaller, more nimble bank. We are optimistic that this will prove not to be the case.

UNITED OVERSEAS BANK (\$\$13.20) 1-STRONG BUY

Investment Summary

UOB continues as our top pick in the sector, with the most optimal risk/reward tradeoff and the strongest core returns, highest capital and best asset quality. The bank is tightly focused on generating ROE through its off-balance-sheet and fee-generating business lines, such as asset management. The bank is gaining share in both asset and liability products versus its domestic competitors. We maintain our 1-Strong Buy rating and recommended list status on UOB.

Key Points

- High Value Added: UOB has been forced to climb up the value chain away from dependence on the pure deposit-taking and lending business by virtue of its high capital levels, which make earning an acceptable ROE on the "plain vanilla" business lines in a low-growth environment virtually impossible. The bank has diversified into asset management and securities trading, and focuses its lending on the high margin consumer and SME segments. This has made UOB the institution in Singapore with the least reliance on traditional interest rate spreads to generate profits. All that remains to drive ROE above 20% is either additional balance sheet leverage or return of capital.
- Loan Growth: UOB's loan growth continues to surprise in a stagnant overall market—
 the bank reported customer loan growth of 6.7% year on year for the first half (5.0% half on half), well above the industry average. Management predicts that loan growth will improve to the "low double digits" by year-end. Lending will come from UOB's red-hot consumer book, where auto finance is the latest product to catch fire, and from its network of SME customers in both Singapore and Malaysia.
- Rates and Margins: UOB's net interest margin (NIM) expanded by 5 basis points to 2.51% in the first half, in line with our expectations. While the cost of interest-bearing liabilities has increased with added leverage, forcing interest spread down from 2.35% in 2H99 to an estimated 1.76% in 1H00, the more-favorable asset mix engendered by loan growth has increased NIM.

Per management, margins in Singapore remained stable, with the growth coming primarily from UOB Malaysia. We anticipate that further margin expansion at the consolidated level will go hand in hand with asset growth, lifting NIM by 4 basis points in 2H00 and by 11 basis points in FY2001.

Asset Quality: UOB's non-performing loans declined modestly during the period, from S\$2.99 billion to S\$2.94 billion. NPLs now total 6.5% of loans, down from 6.9% in 2H99. This is the strongest asset quality in the sector, and has been achieved in spite of UOB's consolidation of Thai and Philippine subsidiaries during FY1999, as well as the company's sizable Malaysian exposure.

- Reserves: We are quite comfortable saying that UOB is fully provided against loan losses. At year end 2000, we estimate under our very conservative methodology that the bank had excess reserves of \$\$368 million, or 4% of gross equity. Management has stated its belief that a substantial portion of the bank's current reserve will be written-back and taken into income over the next two years.
- Strategic Goals: UOB Deputy Chairman Wee Ee Cheong recently reiterated management's off-expressed desire for a Hong Kong acquisition, adding that the bank also sees opportunities in Taiwan and California. Hong Kong and Taiwan are seen as staging points for the bank's eventual move into mainland China, while a west coast US acquisition makes little apparent sense. On the asset management front, UOB plans to announce a mainland joint venture with an "established European name" in the near future.
- Solid Malaysian Franchise: UOB also has significant exposure to the attractive Malaysian market, with local assets of over RM10 billion in its UOB (Malaysia) banking arm. UOBM has its own extensive (26 offices) branch network, which it uses primarily to originate asset products.

Acquisition Strategy

UOB continues to focus on greater China, including Hong Kong, Taiwan, and the Mainland, as markets in which the bank would like to increase its presence.

By the end of the decade, UOB plans to generate 50% of its profits outside of Singapore, up from 17% currently. Non-interest income will also represent a rising percentage of revenues, and is projected to equal net interest income by 2010, up from 1H00's 38%/62% split. We note that UOB is already the institution with the least reliance on traditional interest rate spreads to generate profits.

Hong Kong: In Hong Kong the bank lost I n the bidding for FPB Bank. UOB is exploring the possibility of purchasing another small Hong Kong bank, in order to fill out its branch network, which currently numbers four offices.

It is worth noting that UOB already has a multi-branch license in Hong Kong, and so does not need to buy a bank in order to open as many additional branches as it would like. Rather, management is seeking to minimize expansion costs by leveraging an existing customer base. However, the desirability of the multi-branch license for other non-Hong Kong banks may mean that UOB is either priced out of the market or has to pay an inflated price. Clearly we would prefer the latter.

In contrast to DBS, which wants a substantial Hong Kong franchise in order to smooth out earnings, UOB is looking for a more bare-bones operation which would service its core SME and trade customers and provide a platform for a consumer finance business.

China: The real attraction in Hong Kong will be China access, where UOB has already been quite successful. The bank recently tied up with Allianz in a mainland joint venture to sell investment products. Together, the partners intend to set up a domestic asset management company with a local partner. In addition, UOB plans to add to its existing four mainland offices (Beijing, Shanghai, Guangzhou and Xiamen) as permitted.

Taiwan: UOB is also keen to acquire a bank in Taiwan; with the recent liberalization of foreign ownership, this should be possible. However, UOB insists on majority control (and would generally prefer 100% ownership) and promises to pay only a modest premium, which could make consummating a deal difficult.

Malaysia: UOB has reached its maximum allowable footprint in Malaysia—26 branches, and by all accounts UOBM should post excellent results and growth for the year. Management would consider an acquisition in Malaysia under ideal circumstances, but predicts that Malaysia will not open to foreign takeovers even in 2002, which makes such a potential transaction a far-off possibility.

Indonesia: UOB has renamed its former joint venture with Bank Bali (UOB Bank Bali) UOB Indonesia, and now holds 80% to IBRA's 20% of the profitable (albeit tiny) subsidiary. The UOBI does a mainly trade-related business, with approximately 50% of its book in foreign currency terms. Interestingly, UOBI has foregone the typical concentration of branches in the Jakarta metro area for a spread of eight branches (soon to be ten) with only two in the capital area.

KEPPEL TATLEE BANK (\$\$2.20) 2-BUY

Investment Summary

Keppel Tatlee Bank (KTLB) has begun to show the results of its capital management rethink, although a lack of near-term catalysts has led us to prefer UOB and OUB at the present time. The bank has reconstituted its subsidiaries under a holding company, which will permit lower consolidated capital levels as only the lead bank will be required to meet the MAS' stiff standards. In addition, the new structure will facilitate overseas acquisitions and the addition of strategic partners in each of the group's businesses. However, capital management is still lacking, and as ROE suffers investors have continued to avoid the stock.

KTLB is a compelling value play at this point, trading at only 1.17x adjusted book and 11.1x estimated FY2000 earnings. We rate the shares a 2-Buy.

Key Points

New Structure: KTLB and its subsidiaries are now grouped under a financial services holding company called Keppel Capital Holdings (KCH). The reorganization was carried out by exchanging KTLB shares for KCH shares in a ratio of five KCH shares for every four KTLB shares.

KTLB subsidiaries which were transferred to KCH include Keppel Tatlee Finance (KTF), Keppel Securities, Keppel Insurance, Keppel Bullion and Futures, Keppel Investment Management and Indonesian subsidiary Bank Keppel Tatlee Buana.

In a related move, 71%-owned finance company affiliate KTF underwent its own capital restructuring, and returned S\$177 million to shareholders via a share reorganization. We see this move as a prelude to similar changes at the bank, about which we are very positive due to the beneficial impact they will have on ROE.

- Rates and Margins: While Keppel's middling disclosure makes comparisons difficult, we believe that the bank's margins contracted slightly in the half, from 2.31% in 2H99 to 2.28% in 1H00, primarily due to a rise in the cost of interest-bearing liabilities. This would be only slightly below our estimate level of 2.34%. Management has expressed its view that overall group margins are not shrinking; we await additional information with which to refine our calculations.
- Strong Loan Growth: Keppel TatLee continues to post loan growth, which is well above that of the sector. While total sector loans have increased by only 2.1% YTD, KTLB has managed to expand its loan book by 7.3% in the half and by 16.0% from 1H99, a comparatively blistering pace. This compares extremely favorably with last week's disappointing DBS Bank report of -3.5% loan growth in the first half.

Loan originations were particularly strong in the mortgage and consumer sectors, with balances up 46% and 31%, respectively, on a year-on-year basis. In mortgages alone, Keppel has put on close to \$\$1 billion in assets since 1H99, through a combination of

new originations (\sim 60%) and refinancing or line increases (\sim 40%). The bank has been able to take share through a combination of speed, effective use of phone, branch, and Internet channels, and aggressive pricing.

■ Internet Lending Adds Value Now: The bank's e-lending strategy continues to pay current dividends. We believe that Keppel's asset-led Internet push is the most sensible way to approach on-line banking, as it plays to the needs of KTLB's time-pressured and tech-savvy clientele. Keppel remains the only bank in Singapore to offer not only online applications for loans, but instantaneous on-line approval and commitment.

The bank's Prestige Credit overdraft product, the first such loan system to be placed on the bank's web site, attracted over 10,000 approved customers in its first six months, doubling KTLB's balances and market share in this product while halving marketing expense per closed loan. End-to-end Internet originations now account for 50% of all Prestige Credit accounts open. Per management, 90% of these customers are new to the bank, and their observed credit quality is actually better than that of customers processed through the branch network.

New consumer e-lending products on tap include the long-awaited e-mortgage, which will feature on-line application and "27 minute" on-line approval, e-Margin financing for share purchases, and on-line approval for Keppel's newly-launched credit cards. On the B2B front, Keppel will improve its existing suite of SME and corporate services by inaugurating Internet factoring and on-line corporate treasury management services, which draw heavily on AlB's experience in the area.

- Asset Quality and Reserves: Keppel's asset quality continues to improve, with NPLs falling from 17.6% of total loans in 1H99 and 13.0% at year-end to 11.9% currently. While this is still a high level of classified assets, Keppel is now more than fully reserved by our methodology for all existing and potential loan losses. Provisions fell 63% year on year (and 18% half on half), to \$\$25 million, with roughly half of this amount going towards write-downs on non-loan assets. Given the high level of reserve coverage and declining NPLs, management has indicated that we should now expect essentially nominal provisions over the next 18 months.
- Income and Expenses: Fee income remains strong, albeit on a year-on-year basis (up 11%) rather than on a half-on-half basis (down 18%). The half-on-half decline is largely a result of lower securities trading commissions during the period, as the Singaporean market comes down from the giddy volume of the last half of 1999. Expenses rose sharply across the board, continuing the trend we first saw in the DBS results. However, year-on-year and half-on-half increases of 17% and 5%, respectively, are well off the 30% pace set by the industry leader.

We anticipate further gains in core fee income as KTLB continues to flesh out its product line, with contributions coming from credit cards, bancassurance, and treasury products.

SOUTH KOREAN BANKS

South Korean banks share prices underwent a roller-coaster ride in 2000, as the twin threats of default among the investment trust companies and Hyundai hounded the sector. However, the strong banks were clearly distinguished from the weak banks by the market and our two top picks, H&CB and Kookmin Bank, outperformed the market by 39% and 35% respectively. We continue to recommend these two banks as our top investments in the sector. The key drivers of the sector's price performance in 2001 we expect to be the successful and timely implementation of the second round of financial restructuring, and a resilient consumer segment to support loan growth. Increased pace of mergers among the strong banks we expect also to be a catalyst to drive share prices higher. We reiterated our OVERWEIGHT stance on the Korean banking sector.

Implementation of Round 2 restructuring

Since receiving a US\$58 billion bailout package from the IMF at the end of 1997, South Korea has gone through one major round of financial restructuring. During this first round of restructuring, 11 banks were closed, nationalized or merged. In addition, 477 other financial institutions were also forced to close their operations. Having gone through the painful first round of restructuring, the government embarked on the second round of restructuring. The primary objectives in this second phase are to clean up substantially the bad assets on the banks' balance sheets, boost the capital bases of the weak banks via an injection of public funds and the formation of financial holding companies. In order to fund the second round of restructuring, the Ministry of Finance and Economy (MOFE) had to go cap in hand to the National Assembly to request an additional KRW40 trillion.

After weeks of bickering, debate and delay, the National Assembly finally approved the MOFE's request on December 2, 2000. The government has injected a first tranche of KRW4.13 trillion into six distressed financial institutions at the end of December 2000, while more funds will be disbursed in 1H01 depending on the progress of rehabilitation efforts at the financial institutions. An additional KRW10 trillion is expected to be raised from the recovery of previously injected public funds.

The six weak banks (Hanvit, Seoul, Peace, Kwangju, Cheju and Kyongnam) will receive a combined KRW7.1 trillion in the two tranches. The funds will be in the form of KDIC-issued bonds in exchange for new shares. Given that the losses at some of these banks are so huge that existing capital will be completely wiped out and these banks will be 100% nationalized following the government recapitalization. The government stipulated that these six banks would have to recognize their losses and write-down their existing capital before the government injected fresh funds, which they did at the end of December 2000. Additionally, the banks would have to sign an MOU which clearly lays out productivity and profitability goals. Should a bank fail to attain the specified results, the government would force it to freeze all employee wages and immediately implement additional self-rescue plans.

More stringent monitoring

Given that MOFE has already spent KRW110 trillion of taxpayers' money in the first round of restructuring, the National Assembly has demanded that the usage of the additional KRW40 trillion be conducted in a transparent and fair manner. The key points are that the funds would be injected in tranches, which allows closer monitoring of progress of rehabilitation as well as the requirement that MOFE has to make quarterly reports to the National Assembly.

Figure 15: Allocation and Management of Public Funds

Putting the weak banks together

The government has been trying to kick-start consolidation in the banking sector by placing four weak banks (Hanvit, Peace, Kwangju and Kyongnam) under a state-run financial holding company structure, scheduled to be launched in 1Q01. We would highlight, however, that such a structure does not reduce the number of banks as the four banks are still allowed to operate as separate entities. The government is also attempting to sell off Seoul Bank in 1H01 for foreign investors, failing which it would also be placed under the holding company. The holding company structure was promulgated as a compromise with the labor unions, which strongly voiced their opposition to an outright merger, as it would mean massive layoffs. Nevertheless, it is a meaningful step forward for the government as it will eventually be able to restructure the business operations of the banks under the holding company.

The placement of the weak banks under the holding company structure is also positive news for the good banks because the government will not force them to take over the weaker banks. Indeed, the authorities stated that the good banks are welcome to join in

the state-run holding company if they want to. We believe the market should increasingly be confident that the government will not force a good bank/bad bank merger. This is especially so in the case of Kookmin and H&CB as they are widely held by foreign investors as well as having strategic foreign partners (Goldman Sachs with a 11% stake in Kookmin and ING Bank with a 10% in H&CB).

Mergers...slowly but surely

Amid the second round of financial reform, we also expect mergers among the good banks. In the case of Hana and Koram, the possibility of a merger was muted at the beginning of the year, but nothing has happened in part due to disagreements between the shareholders. Amongst the strong retail banks, Kookmin and H&CB have already announced that they have signed a memorandum of understanding to merge.

Share price targets raised for H&CB and Kookmin

A merger between Kookmin and H&CB makes a lot of sense as their business lines are complementary. Kookmin runs a lucrative credit card subsidiary and has established a strong niche in SME lending, while H&CB is the market-leader in mortgages and personal loans. The merger would thus create a retail banking powerhouse. Additionally, the merged entity would the largest bank in South Korea with total assets of US\$125 billion, almost twice the size of the next largest bank. In a regional context, the merged institution would be the second largest bank in Asia ex-Japan, after HSBC.

(KRWbn)	Kookmin	H&CB	Mergerd entity
Loans	48,556	41,977	90,533
Assets	93,563	64,380	45.0
Deposits	69,281	52,565	46.2

Branches	587	550	46.5
NPL%	7.8	6.8	57.0

^{*}Data as of Sept 30, 2000 and assuming pooling-of-interest

Source: Bank data.

While the labor unions will attempt to delay any proposed bank mergers by threatening to strike, the government has also stated that it will remain on the reform path and not allow the unions to derail the much-needed restructuring in the sector. Additionally, the recent strikes at Kookmin Bank and H&CB failed to gather support from other bank unions, underscoring our view that the necessary reforms are increasingly being accepted by the employees. We believe that the government/management will eventually be able to work out a mutually agreeable pact with the unions.

With the merger announcement, we believe the H&CB and Kookmin valuations will expand. In the case of H&CB, it has traded as high as 1.6x PBR in the past 52 weeks. Given that the investment environment is increasingly brighter, we expect the stock to trade at 1.6x 2001 book value, which raises our share price target to KRW42,000

(from KRW36,000). Similarly, we believe Kookmin deserves to trade at 1.6x PBR, which pushes up our new share price target to KRW22,000 (from KRW18,000).

Declining trend in bad debt expected to reverse

As part of its restructuring plan in the corporate sector, all banks were required to produce a list of non-viable companies in early November 2000. After going through 287 companies, the banks announced that 29 of these companies are non-viable and should undergo court receivership or be liquidated. As a result of these findings, the amount of substandard and below loans (bad loans) has increased in 4Q00. Until then, the bad loan amount and ratio have been consistently declining throughout this year. With the announcement of the 29 companies, and coupled with a marked slowdown in the economy forecast for 1Q01, we expect the bad debt ratio in Korea to rise to 13% by end-00 and 15% in 1H01, before retreating slightly in 2H01.

Role of KAMCO

Since the crisis started three years ago, the banks have been reducing their bad loans by selling them to the Korea Asset Management Company (KAMCO), the state-run agency authorized to purchase and dispose non-performing assets from financial institutions. As of end-November, KAMCO had purchased a total of KRW82.9 trillion (face value) of NPLs at KRW33.7 trillion. Much of the NPL sales this year were from the investment trust companies (ITC) which were big holders of Daewoo debt.

Unlike countries like Taiwan and the Philippines in which state-run asset management companies have yet to be established, KAMCO has played a crucial role in helping the banks monetize their non-performing assets. In turn, KAMCO attempts to collect on these loans, hold public auctions or issue ABS to dispose of these NPLs. To date, the agency has been able to dispose of KRW41.8 trillion of NPLs. The ability of KAMCO to continue to purchase more NPLs from the banks will be crucial for the fundamental turnaround of the more distressed banks.

Growth opportunities in retail lending

Coming from the brink of a total collapse of the banking sector during the Asian financial crisis, many of the private sector banks have successfully restructured their balance sheets and operations. Consequently, they are on track to record a significant rebound in earnings growth and expanding ROEs in both 2000 and 2001, largely on the back of strong retail demand for (i) mortgages, (ii) credit cards and (iii) personal loans. Our economists project private consumption in Korea to grow 3.3% in 1H01 and accelerate to 6.5% in 2H01. Coming off a high base in 2000, we expect overall loan growth in the sector to be a relatively healthy 16% and 14% in 2001 and 2002 respectively.

The private sector banks are much better positioned to benefit from the growth opportunities in the retail segment. H&CB, for example, has 50% of its loan books in mortgage lending, while 31% goes to other personal loans. Such exposure has enabled the bank to register overall loan growth of over 35% in the first nine months of 2000, and which we believe will continue to help support a healthy 19% growth in 2001. H&CB's merger partner, Kookmin is strong in credit cards as well as lending to the SME market. As such, the merger of these two private sector banks will create a retail banking powerhouse.

Top picks

We continue to adopt an Overweight stance in Korea, based on our belief that reforms will accelerate in 1HO1 and that strong domestic consumption will fuel loan growth. Additionally, valuations for the banks are not demanding, trading at less than 1.3x PBR for most banks. For specific investment opportunities in the sector for 2001, we would strongly recommend the retail banks H&CB and Kookmin Bank. These two banks are our top picks in the sector. They will directly benefit from (i) strong private consumption growth, especially in 2HO1, due to their strengths in retail lending, (ii) relatively lower loan exposure to *chaebol*, and (iii) strong foreign strategic investors. The eventual merger between these two banks will also greatly strengthen their leadership position in the Korean banking sector.

HANA BANK (KRW6,840) 2-BUY

Investment Case

Niche in serving the high net worth individual Hana Bank has built its banking business by focusing on high net worth individuals (defined as individuals with more than KRW100 million on deposit), and has succeeded in becoming the fourth largest bank by won deposits in Korea. Some 63% of this deposit base is from about 36,000 high net worth individuals.

Moving into retail banking and SME lending

On the asset side of its balance sheet, Hana's loan portfolio is still largely exposed to large corporates, largely due to its legacy as a corporate lender. This market segment presently accounts for 50% of its total loan books. We would highlight, however, that its corporate loan exposure was higher than 60% in 1998. The reduction is in line with management's strategy of expanding more aggressively into retail lending by leveraging off its strength in attracting retail deposits. From its traditional niche of high net worth individuals, Hana is moving into the middle and mass market segments. Key product lines that management has been concentrating on are credit cards, mortgage and personal finance lending. This strategy has been successful as evidenced by the contribution of retail lending to total loans increasing from 13% in 1998 to 20% as of September 2000.

Another area of focus is lending to the small and medium size enterprises (SMEs). However, the bank is facing very stiff competition from Kookmin Bank and Shinhan Bank as these banks have done very well in building this part of their business. Consequently, the share of SME lending as a percentage of total loans has increased by a much lesser magnitude, from 27% in 1998 to 29% in September 2000.

Merger talks with Koram Bank stalled Hana forged a strategic alliance with Koram in June 2000, whereby the two banks will join together in information technology and Internet banking. Such an alliance was aimed at lowering required investments by jointly developing IT systems, which both banks will use in their branches and ATMs. Even prior to this alliance, both banks had been rumored to be in merger talks, and this alliance was seen as a prelude to a full merger.

However, after months of talks, the two banks failed to come to a firm agreement to merge. Subsequently, Hana management stated that the two banks have abandoned merger negotiations, largely due to disagreements among the shareholders, on January 1, 2001. Management also added that it is open to any other merger proposals, although there are none at present.

Valuation

We view Hana as fundamentally a sound bank with good asset quality. However, it lags the other strong retail banks in terms of strategy and profitability. We continue to rate the bank as a 2-Buy due to its cheap valuation of 0.6x PBR.

H&CB (KRW29,900) 1-STRONG BUY

Investment Case

Best regarded and professionally run bank

H&CB became the first Korean bank, and only the third Asian bank to list its American Depository Receipts (ADRs) on the NYSE. The listing of H&CB's ADRs is an indication of the bank's strong fundamentals, prudent management and superior financial reporting and transparency. Additionally, the listing serves to expand further its investor base. In a market where investors have been perennially frustrated by lack of disclosure and transparency, the bank has done very well to be able to distinguish itself in these aspects. Management has also emphasized releasing information to all investors at once and shied away from making any pre-earnings releases or statements. All this reflects the professionalism of the bank.

Merger with Kookmin would create retail banking powerhouse The bank announced in the last week of December that it had signed a Memorandum of Understanding with Kookmin Bank to merge before the end of 1HO1. Both banks are currently in the process of conducting due diligence and the stock exchange ratio is scheduled to be announced at the end of January. It is also worth highlighting that one big concern was that the labor unions would cause the merger to collapse. However, as witnessed in the strike that the unions held at both banks in the last week of December 2000, the staff failed to gather sufficient support from the other unions at other banks and eventually returned to work on the last day of the year. This underscores our view that the necessary reforms are increasingly being accepted by the employees.

A merger between Kookmin and H&CB makes a lot of sense as their business lines are complementary. Kookmin runs a lucrative credit card subsidiary and has established a strong niche in SME lending, while H&CB is the market-leader in mortgages and personal loans. The merger would thus create a retail banking powerhouse. Additionally, the merged entity would the largest bank in South Korea with total assets of US\$125 billion, almost twice the size of the next largest bank. In a regional context, the merged institution would be the second largest bank in Asia ex-Japan, after HSBC.

Good asset quality

Being a retail bank and having prudent management, H&CB has one of the lowest NPLs in the country at 6.8% as of September 2000. Its NPL coverage ratio of 46% is in line with the sector, and management is focused on improving this ratio to 60% - 65% in 2001. The fact that the bank has traditionally lent to the consumer segment and has much less exposure to the *chaebol* is the key reason we believe the bank would be able to contain its NPLs to less than 6.5% this year.

Valuation

The stock was the best performing Korean bank stock in 2000, out-performing the broader market by 39% in 2000. With ROEs expected to reach 28% this year, and still trading at an undemanding 1.1x PBR, we continue to rate H&CB as one of our top picks in the sector.

KOOKMIN BANK (KRW17,800) 1-STRONG BUY

Investment Case

SME and household loans to drive loan growth

Kookmin has a very strong retail banking franchise, perhaps second only to H&CB. The bank has 34% of its loan book exposed to the household sector (mortgage and personal loans), which has helped to boost overall loan growth. As of September 30, 2000 mortgage loans grew 41% year on year while personal loans grew 35% year on year. We expect these two segments to remain key drivers of loan growth, albeit decelerating to more sustainable growth rates of 23% and 16% respectively in 2001. The bank also specializes in serving the SMEs, especially companies engaged in technology-related manufacturing. We forecast, however, that loan growth to SMEs will decelerate to 14% next year, after increasing 26% this year. Overall, we expect loan growth to reach 14% in 2001.

Strong credit card franchise

The bank holds a 74.3% stake in publicly listed Kookmin Credit Card, which is the third largest card issuer with 7.2 million cards-in-force and a 18.2% market share. Although competition in the credit card sector is heating up, we note that the government is playing an active role in encouraging credit card usage. Measures introduced by the government includes: (i) up to KRW3 million of credit card spending may be tax-deductible for individuals; (ii) credit card receipts double as state-sponsored lottery tickets and (iii) corporate travel and entertainment expenses charged to credit cards are tax-deductible.

Merger with H&CB would create retail banking powerhouse The bank announced in the last week of December that it had signed a Memorandum of Understanding with H&CB to merge before the end of 1H01. While there were initial fears that such a plan would be thwarted by the banks' labor unions, the strikes failed to gather wide support and did not affect either banks' operations. A merger between Kookmin and H&CB makes sense as their business lines are complementary. Kookmin runs a lucrative credit card subsidiary and has established a strong niche in SME lending, while H&CB is the market-leader in mortgage and personal loans. The merger would thus create a retail-banking powerhouse. Additionally, the merged entity would the largest bank in South Korea with total assets of US\$125 billion, almost twice the size of the next largest bank. In a regional context, the merged institution would be the second largest bank in Asia ex-Japan, after HSBC.

Valuation

Coming from two years of losses brought about by the crisis, Kookmin is expected to rebound strongly to achieve ROEs of 18% and 24% in 2000 and 2001 respectively. Earnings should be buoyed by lower loan loss provisions and its SME and retail focus on lending. Notwithstanding its good earnings prospects, the stock is trading at very attractive valuations of 1.3x PBR and only 5.7x 2001 earnings. Kookmin is one of our two top picks in the sector.

KORAM BANK (KRW5,930) 2-BUY

Investment Case

BoA relationship has benefited the bank

KorAm Bank was founded in 1983 as a joint venture between Bank of America (BoA) and a group of Korean companies, including Samsung and Daewoo. Largely due to the presence of the US bank, KorAm's management has been able to operate independently from the government and did not engage in government-directed lending. Rather, it was able to make independent credit decisions by adopting BoA's credit procedures and systems. Having been invested in the bank for close to two decades and partly due to its own merger in the U.S., BoA has indicated its interest to eventually sell-off its present 10.1% stake.

Entry of another foreign strategic investor – the Carlyle led consortium The potential exit of BoA from KorAm should not be a concern that the bank would lose its independent banking practices. This is because another US consortium consisting of the Carlyle Group and J.P. Morgan Corsair has successfully purchased KorAm's global depository receipts (GDRs) in November 2000. The consortium paid KRW444.7 billion for the newly issued GDRs at KRW6,800 per share, and thereby became the bank's single largest shareholder with a 40.1% stake. The other large shareholders in the bank include BoA (10.1%), Samsung (10.1%) and KDB (7.7%).

Huge provisions to be taken in 2000

With the entry of the US consortium, management will adopt J.P. Morgan's advanced financial technology. More importantly, KorAm will fully provide for all of its loans classified as substandard and below, which at September 2000 amounted to KRW1.85 trillion. Given that the bank has existing loan loss reserves of KRW850 billion, it will set aside loan loss provisions of approximately KRW1.0 trillion in 2000. With such a huge one-time provision, management estimates that the bank will register a net loss of KRW460 billion in 2000, which will result in its BIS capital adequacy ratio declining from 11.5% to 8.5%. On the other hand, such aggressive provisioning would establish KorAm as the bank with the highest NPL cover of 100%.

Merger talks with Hana collapsed

The entry of the Carlyle-consortium, however, has stalled the merger negotiations with Hana Bank. While KorAm has expressed the merits of such a merger, the US investor has balked in giving its approval, presumably because it would prefer to concentrate on improving the operations of KorAm first. We understand also that there have been disagreements over the stock exchange ratio that would be used to effect any potential merger.

Valuation

Although KorAm will report a large loss in 2000, the bank will start 2001 with a much cleaner balance sheet. Provisions will be substantially lower this year and we forecast the bank to be able to achieve ROEs of 20% this year. Despite its strong profitability, the bank is trading at only 1.0x PBR and 4.7x PER. We have upgraded the stock from 3-Market perform to 2-Buy.

SHINHAN BANK (KRW11,650) 1-STRONG BUY

Investment Case

Pursuing financial holding company structure

In an environment where even the strong banks are seeking to merge with each other, Shinhan Bank has decided to stay independent and instead focus on re-organizing itself into a financial holding company. Following the passage of the Financial Holding Company Act in October, Shinhan is aiming to be the first Korean bank to adopt a holding company structure. Most major banks in Hong Kong and Singapore have already formed such holding companies and Korean banks are now following suit. The key advantages of forming a holding company are (i) consolidating new, non-interest revenues and (ii) more efficient capital adequacy management as non-bank assets are not considered in computing BIS ratios.

Under the holding company, Shinhan envisages five key subsidiaries: (i) commercial bank; (ii) life insurance; (iii) brokerage; (iv) asset management and (v) financial portal.

The commercial bank would be the key subsidiary, accounting for more than 90% of the holding company's assets. However, management is aiming to attract foreign partners to help shape the other subsidiaries to be leaders in their respective market segments. Management also expects such a structure to boost overall revenues via cross-selling, whereby the bank branches would serve as distribution channels. Management is aiming to finalize its holding company structure and seek approval from the authorities by March 2001.

Aiming to place Cheju Bank under its holding company

Following initial press reports, Shinhan management has publicly stated that it is agreeable to acquiring Cheju Bank, a small provincial bank that has requested capital infusion from the government. The provincial bank's total assets account for less than 3% of Shinhan's. Shinhan officials emphasized, however, that the bank would only consider placing Cheju under its holding company structure after the smaller bank had been recapitalized by the government and operations have normalized. Shinhan's holding company is expected to be established in March 2001 at the earliest. In the meantime, the bank has signed a management advisory agreement with the Cheju, in which Shinhan management would help the weaker bank with reconstruction.

Valuation

Notwithstanding its good share price performance in 2000, where it outperformed the KOSPI by 35%, Shinhan is still trading at only 1.0x PBR. The bank has the best asset quality in the sector, with NPLs at 4.8% and an NPL coverage ratio of 57%. Coupled with its sound capital adequacy ratio of 13%, we believe Shinhan is an attractive bank investment.

TAIWANESE BANKS

The Taiwanese banking sector is facing a crucial stage in its development. While it escaped relatively unscathed from the 1997 Asian financial crisis, asset quality is now at its lowest level ever. Lack of transparency and less stringent classifications have led to nagging suspicions that the worst is yet to come. Coupled with our pessimistic view on the macro outlook for the island, we believe the banks will be facing a very challenging 2001. The sector also remains very fragmented, with the less efficient state-banks still accounting for about 75% of total banking assets. Until we witness the authorities aggressively tackling the NPL issue and consolidation is accelerated, we remain Underweight the sector.

Bleak macro outlook

The macro-economic outlook for Taiwan has been deteriorating since we downgraded the sector to Underweight in September 2000. The latest economic data show that growth in industrial production more than halved in October to 7.2% year on year, from 16.6% in the prior month. Likewise, export growth declined to 10.3% in November, from 19.4% in October. One of our biggest concerns with the Taiwan economy stems from the impending slowdown expected in the electronics industry. Growth in the export of electronic products was 32% in November, compared to 47% in the first ten months, while exports of telecommunication products grew only 11%, compared to 32% in the comparable periods. Against such an economic backdrop, our economists have further revised down their 2001 GDP forecast from 4.3% to 3.7%, which would be the island's lowest economic growth rate since 1982.

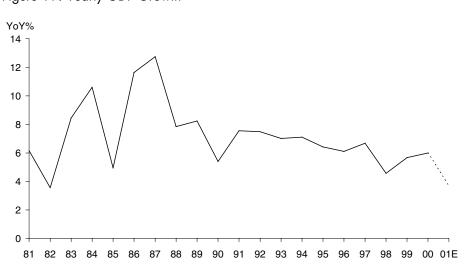

Figure 19: Yearly GDP Growth

Source: Lehman Brothers

Asset quality is key concern

With a much more challenging economic outlook ahead, we believe that Taiwanese banks are headed for a sharp cyclical slowdown in 2001. Of greatest concern is the quality of the banks' loan books. The non-performing loan classifications in Taiwan are less stringent than regional and international standards. For example, missed payments on installment loans are classified non-performing only after six months, rather than three months.

We are also particularly worried about cases where the government essentially forced the banks to restructure the loan, but yet the banks were not allowed to classify these accounts as NPLs even though interest and principal would not be paid in the next six to 12 months. Given such instances, it is perhaps little wonder that the market has remained sceptical over the true asset quality in the banking sector. Consequently, even though the officially released NPL ratio for the sector is 5.5%, we believe that the figure is closer to 10%. The government recent conceded that under a broader definition, NPLs in the sector stand at 8.4%. In any case, we believe that NPLs in the system will continue to trend up, and we expect NPLs to reach 12% in 2001.

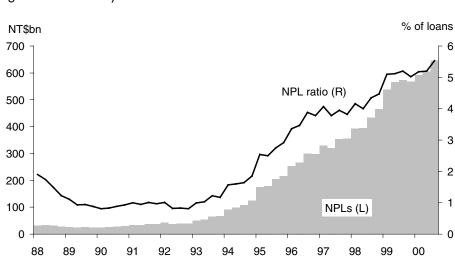

Figure 20: Quarterly NPL

Source: Lehman Brothers

Still in denial

The government has been very slow in introducing other policies to address the rising NPL issue. Indeed, it appears to still be in the denial phase and MoF officials have insisted that bad loans are not a problem in Taiwan. Consequently, the authorities have been dragging their feet in the setting up of a state run resolution trust corporation (RTC), and instead have been trying to attract foreign investment banks to set up privately run asset management corporations (AMC).

The Bank Association of the Republic of China has announced that it is aiming to raise NT\$15 billion in its first stage of fund raising, which involves largely domestic banks. To date, 33 domestic banks have agreed to join the AMC. Officials stated that the association would also seek to raise an additional NT\$10 billion in the second stage by tapping foreign funds.

While the AMC concept appears to make sense, the key question is who is going to shoulder the shortfall between the face value and the market value of these NPLs. To the extent that state-owned or controlled banks account for about 75% of banking assets, and that these banks have much greater NPLs than the private-sector banks, the government has to realize that it would have foot the bill. We believe that until the government takes concrete steps to curb and reduce NPLs in the sector, the situation will only worsen, especially given our pessimistic outlook for the overall economy.

One way that the authorities did try to curb the rise in NPLs is to encourage the banks to accelerate bad loan write-offs by providing tax incentives. From January 1, 2001, the banks' 2% business tax rate has been totally eliminated. The business tax rate for the banks was first cut to 2% from 5% on July 1, 1999. The banks will be required to use the tax savings to write off their bad loans. Such measures will help to cushion the impact of bad loan write-offs on the banks' bottom lines.

Weak loan demand

Unlike South Korea where retail banks stand to benefit from strong demand for mortgage and personal loans, loan demand in Taiwan has been weak across most segments. As of October 2000, consumer loan growth was barely 5%. This dragged overall loan growth down as they account for almost 40% of total loans. While loans to the manufacturing sector still increased 12.8% in the same period, we believe that corporate demand for credit will inevitably weaken given our more cautious view on the electronic sector. Credit cards is the only segment in which we see continued strong demand. As of September 2000, credit card receivables in the sector grew by a robust 33%. The impact on overall growth, however, was negligible given that credit cards receivables account for only 1.7% of total credit. Over the next twelve months, we forecast overall loan growth of only 5.0%, a deceleration from an estimated 6.5% growth in 2000, before picking up to 6.8% in 2002

Too fragmented

There are 52 domestic banks (including five medium business banks) and 41 foreign banks in Taiwan. The largest bank in Taiwan (Bank of Taiwan) accounts for only 11% of total deposits in the sector, with the top five banks accounting for 39%. With the sector becoming increasingly competitive, we believe that bank consolidation in Taiwan is inevitable. Although the authorities have been discussing sector consolidation since 1998, there have not been any notable mergers.

Indeed, the government publicized at the end of 1999 that three state-owned banks (Bank of Taiwan, Land Bank of Taiwan and Central Trust of China) would be merged, only to announce 12 months later that the plan had been suspended. The slow pace of mergers can be attributed to three factors: (i) layoffs which usually accompany mergers are socially unacceptable, especially among state-owned/controlled banks; (ii) the private banks are generally still profitable, which reduces the urgency to merge and (iii) MoF's inability to introduce merger incentives quickly. The authorities only managed to finally offer tax incentives to merging banks in November 2000.

Recommended exposure

Given the poor operating outlook for the sector and our view that NPLs will continue to rise significantly, we continue to recommend investors Underweight Taiwanese banks. The only bank that we would recommend for exposure to the sector is Chinatrust. This bank has superior asset quality, a well-diversified loan portfolio between the corporate and retail segments and a lucrative credit card operation.

CHINATRUST (NT\$23.00) 1-STRONG BUY

Investment Case

Dynamic and resilient private sector bank

Against an increasingly challenging operating environment, we believe Chinatrust will be one of the better performers given its competent management team, sound asset quality and diversified loan portfolio. While many of the private sector banks have largely focused on consumer lending, Chinatrust has a more balanced loan portfolio, with 58% of its loans to the corporate sector. Among its retail banking activities, its focus on home equity loans and credit card receivables has enabled the bank to register above-average growth. In the first nine months of 2000, the bank's total loan portfolio grew 12.6% year to date and 20% year on year, which is ahead of the sector average loan growth of 7% year on year. This implies that Chinatrust continues to grab market share mainly from the state-owned banks.

Number one credit card issuer Chinatrust was one of the first banks to issue credit cards back in 1974 and has since managed to expand this business substantially. The bank is currently the largest credit issuer on the island, with 17% market share. In addition to its ordinary credit cards, it also has a tie-up with department store Takashimaya. From 2.4 millions cards-in-force at the end of September, we expect the bank to expand its portfolio to three million cards by the end of 2001 and contribute 29% to the bank's pre-tax profits.

Looking to set up AMC

The government has stated that it would like to see the private banks and foreign banks play an active role in setting up asset management companies (AMC). While Chinatrust has no problem managing its own NPL portfolio, the bank is studying the feasibility of setting up an AMC to manage some of the rising NPLs in the system. We believe that with a more challenging macro environment over the next 12 months, NPLs in the sector (especially among the state banks) will be rising.

Room for issuance of subordinated debt

The bank issued non-convertible preferred shares in the domestic market in the third quarter, raising NT\$2.5 billion. This helped to boost its CAR from 9.5% to 11%. The preferred shares carry a dividend rate of 6.12% with a six-year tenure. Management has emphasized that it would only seek to raise debt-like instruments in the current environment instead of a dilutive rights issue. Indeed, with the recent approval by the MoF for banks to issue subordinated-debt, which would quality as Tier 2 capital, we believe Chinatrust management will be keen to tap this window as the need arises.

Valuation

While its share price has performed, outperformed the sector by a mere 7% in 2000, Chinatrust enjoyed a strong rally in the past month, outstripping the Taiwan Weighted Index by 22%. Given that the bank is expected to achieve 15% ROE in 2001, the highest in the sector, we believe that its current valuation of 1.5x PBR is undemanding. The stock is our recommended exposure to an otherwise Underweight sector.

BANK SINOPAC (NT\$16.10) 2-BUY

Investment Case

Niche in mortgage lending and other personal finance Bank SinoPac is one of the 16 "new" banks granted a banking license in 1992. While SinoPac is considerably smaller, in terms of asset base, than the government-linked banks, it is a professionally run bank with a strong niche in mortgage financing. In the corporate banking segment, SinoPac has concentrated on serving the electronic/technology manufacturers.

SinoPac's traditional niche is in serving the consumer, especially the homebuyer. Management concedes that demand for primary mortgage loans has been weak. However, the bank managed to boost its secondary mortgage business through attractive financing schemes. Additionally, the bank is also offering a personal revolving credit facility backed by a mortgage. The amount of revolving credit is limited to the principal repayment from the original mortgage loan. This ensures that the revolving credit is secured by collateral.

Excellent asset quality

largely due to its exposure to the lower-credit risk mortgage segment, SinoPac boasts of having the best asset quality in the sector. Its NPL portfolio is (on a three-month past due basis) barely 1.0%. Such a low NPL ratio is indeed remarkable especially given that the official NPL ratio for the sector is 5.5%. More importantly, the bank's NPL coverage ratio is also the highest in the sector, at approximately 90%. Management emphasized that it would continue to improve its overall asset quality with aggressive write-offs and maintaining its current rate of provisioning. Prior to the crisis, the bank has managed to provide more than 100% of its NPLs every year.

An attractive merger and acquisition target

With high asset quality, a strong niche in consumer lending and attractive valuations, it is not surprising that SinoPac has become a prime merger and acquisition candidate. Especially with the MoF permitting domestic banks to be fully owned by foreign banks, the market has been rife with speculation that the bank is being sought after by both foreign and domestic banks. At the end of December 2000, Taiwan's leading investment bank, China Development Industrial Bank (CDIB) conceded that it is in the preliminary stages of merger talks with SinoPac. The latter bank's management, however, has stressed that nothing firm has been discussed and it is too early to say if the two banks will merge.

Valuation

In terms of shareholder make-up, SinoPac is one of the most widely held Taiwanese bank stocks with qualified foreign institutional investors holding more than 35% of the stock, a testimony to the bank's fundamentals. Indeed, the stock outperformed the broader market by 30% in 2000 and 22% in the past month. The stock is currently trading at a undemanding 1.2x PBR. However, its profitability lags Chinatrust and we continue to rate it a notch lower at 2-Buy.

TAISHIN INTERNATIONAL BANK (NT\$16.40) 3-MARKET PERFORM

Investment Case

A top tier credit card issuer

Taishin International Bank is one of the 16 private banks and was granted its banking license in 1992. While the bank has an almost equal split between its corporate and consumer banking loan books, it is best known as a major credit card issuer. With over one million cards in force, Taishin is the second largest domestic issuer in Taiwan.

The bank was the first among the 16 new private banks to issue credit cards. In 1998, it adopted a no annual fee policy in order to boost its card in force. Consequently, Taishin currently has 1.18 million cards issued, with the VISA credit card accounting for almost 80% of its card portfolio. Taishin has a 7% market share and ranks as the second largest domestic issuer (third largest if we include Citibank). Management stated that with its credit card business contributing about 25% of the bank's pretax profit, it would continue to focus on the growth in this segment. Through its tie-up with Shin Kong Matsukoshi, one of the leading department store chains in Taipei, management is confident that it can increase its card base to at least 2.1 million by the end of 2001, from the present 1.7 million cards.

Asset quality in line with other private sector banks

Taishin registered NPLs of 2.4% as of November 2000 is in line with those of other private banks in Taiwan. If we include the NPLs of state-owned banks, the sector NPLs were 5.5%. If we were to add the bank's Other Real Estate Owned (OREO), its total non-performing assets (NPA) ratio is slightly higher at 2.8%. Again, this ratio is very much in line with that of the private bank sector. Its OREO is low given its propensity to sell the backing collateral as soon as possible. Similar to other banks, Taishin has also been rather aggressive in writing off its bad debts. Coupled with the provisions that it has set aside, the bank currently has an NPL coverage ratio of 42%. While this ratio is comparable to that of the sector, we expect the bank to continue setting aside large provisions in order to improve its NPL coverage ratio to 57% this year.

Exposure to the construction sector is a concern

While management has done well to contain its NPLs, we would highlight that its exposure to the construction sector at 13% is higher than the sector average, which is only 4.1%. Management has conceded that its exposure to this segment is a concern, given how weak the construction industry has been, and thus it is looking to reduce its exposure to less than 10%.

Valuation

While Taishin is a fundamentally sound bank, we are worried about its exposure to the construction sector. As such, even though its valuation of 1.1x PBR is not demanding we would rate the stock as a market performer. For exposure to the small private sector banks, we recommend investors focus on SinoPac instead.

UNITED WORLD CHINESE COMMERCIAL BANK (NT\$25.40) 4-MARKET UNDERPERFORM

Investment Case

Access to low cost deposits due to its status as the largest stock-clearing bank UWCCB is the second largest private sector bank in Taiwan. Over the years, it has managed to establish a niche as the largest clearing bank for Taiwan's stock market. This gives the bank access to the deposits of the retail investor, which are very active in trading on the local market. Given that these deposits are liquid and easily transferable between accounts, they usually remain in UWCCB as virtually zero cost funds. This enables the bank to have lower average cost of funds compared to its peers.

In order to facilitate fund transfer for its clients who tend to do so using the PC, the bank tied-up with local ISP is.net to provide exclusive telecommunication lines to customers. Known as Virtual Private Dial-up Network (VPDN), this Intranet system allows its clients to perform fund transfers at home or at the office.

Weak asset quality

UWCCB has the highest NPLs among the banks under our coverage at 2.7% and NPL coverage of 40%. We would caution that such a ratio fails to include its exposure to the distressed Ever Fortune group. If we do so, NPLs would rise by 1.8 percentage points to 4.5%. This Ever Fortune issue highlights one of the key concerns that investors have over the banking sector. This conglomerate had to request a restructuring of its loan in September 2000, for which UWCCB is the lead creditor. However, despite having to lower the loan rate by 125bps and postponing principal repayments for two years, the MoF has allowed the banks to not classify the exposure as non-performing. We are also concerned about UWCCB's loan exposure to the real estate and construction sector, which stands at 25% of total loans as of September 2000.

Merger with state-controlled banks not positive

Following the passage of the merger bill in November 2000, the market started speculating that UWCCB might be merged with state-controlled Chiao Tung Bank and International Commercial Bank of China. While such a merger is positive for the sector as we have long argued that it is too fragmented, it would not be positive for UWCCB as all three banks are largely focused on corporate lending, and as such their business lines are less complementary. Additionally, being merged with a state-controlled bank would also be viewed negatively by the market, especially as layoffs are socially sensitive.

Valuation

Having rallied 20% in the past three months, the stock is currently trading at 1.3x PBR. Given that its expected ROE for this year is relatively low at 11%, the bank is consequently trading at a higher PER multiple. In fact at 11.5x prospective earnings, UWCCB is the most expensive stock in our universe. We have rated the stock a 4-Market Underperform.

MALAYSIAN BANKS

We are maintaining our Underweight position in Malaysian banks and expect that the share price performance of these banks will continue to drift sideways as a result of continual "merger pains". In 2000, the shares of Public Bank and Commerce Asset were down on the year, 25% and 16% respectively. Meanwhile, the shares of Maybank, were flat on the year. Although Maybank has been having problems with the acquisition of Phileo Allied, the small size of this target will not have any meaningful impact on the acquisitor. The next phase of the merger process will require integrating back offices and information technology platforms as well as streamlining branch networks and consolidating staff numbers. The whole process will still require significant management time and effort, and we believe the core banking operations will suffer, which will be reflected in share price performances.

Figure 21: 12-Month Price Performance

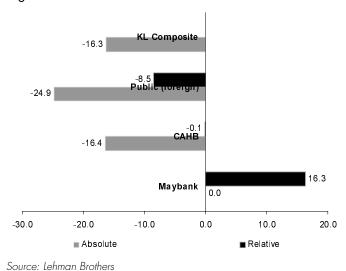

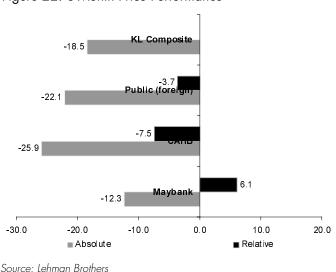

Figure 22: 6-Month Price Performance

Six down, three in the process and one starting from scratch

Of the ten proposed mergers, six were completed on time, three are in the final stages and one is starting over again. The following banks have completed theist merger processes: Bumiputra-Commerce, RHB Bank, Hong Leong Bank, Multi-Purpose bank, Southern Bank and EON Bank. Meanwhile the following are still in the process of completing there mergers (largely paper work): Maybank has been given until January 29 to finalize its acquisition of PhileoAllied, Public Bank has revised its agreement with Hock Hua Bank and is in the process of completing this transaction, while Perwira Affin Bank is also in the final stages of its acquisition of BSN Merchant Bankers. The only transaction that could not be completed was the one between AMMB and Utama Bank Group, which has now been cancelled. Consequently, AMMB is now seeking to acquire MBf Finance from Danmodal and the Utama Group is pursuing a merger with EON Bank.

In all, 94% of total bank assets of the domestic banking sector have been rationalized and consolidated. The government is forcing its 21 banks, 25 finance companies and 12 merchant banks to merge into ten anchor institutions.

Despite the "lack of pain" that Malaysia's banking system has had to endure relative to its regional counterparts, it is undertaking ambitious banking sector reforms and consolidation. Industry consolidation was on the agenda long before the crisis, however with little results — five mergers in the last 15 years. While we view consolidation as a positive, policy driven consolidation runs the risk of moral hazard.

Thus, because market-driven consolidation was not occurring fast enough, the government has taken a pre-emptive move to strengthen the local banks and prepare the sector for foreign competition. As part of its bid for entry into the World Trade Organization, the financial sector is to be liberalized and opened up to foreign competition. Ultimately, the ideal number of local banks should be four to six, which would be on par with the number of foreign banks.

Are the mergers just going to create larger entities, or are these banks going to be better and more efficient entities? In the near term, cost savings will be minimal since BNM is against staff retrenchment and branch rationalization – it recently indicated that it will allow voluntary separation schemes. In addition, revenue enhancement and organizational synergy will also be limited given the current weak demand for credit. However, over the longer term, banks will benefit from natural attrition of staff and the return to meaningful loan growth.

Now that the mergers are largely complete, the next hurdle is the RM2 billion capital minimum requirement by the end of 2001 that the central bank has imposed. Of the ten anchor banks, only Maybank, Bumiputra-Commerce Bank, RHB Bank and Public Bank meet this requirement. Therefore, this would imply that there may be a lot of capital raising efforts in the market this year.

The aftermath of the mergers is likely to be more headaches, particularly integration problems on both the IT side as well as the product and staff side. The result will likely be higher operating expenses. We project that the cost to income ratio at the three banks that we cover will increase an average of 6.3 percentage points to an average of 40%. Thus, cost savings from the mergers are not likely to accrue for at least two to three years.

NPLs on the rise

Gross NPLs (on a three-month basis) in Malaysia increased by 1.6% to approximately RM50.7 billion at the end of October. This was the second straight month that NPLs increased, which is of concern, but not distressful because the overall NPL ratio in the country is still low. The NPL ratio for Malaysia is 11.3% at the end of October, which is a significant improvement from the 15.3% at the start of the year.

Resumption of loan growth, driven by consumer finance

Loan growth appears to be recovering, following two years of contraction. In 1998 and 1999, loans contracted by 2% and 5% respectively, loans have increased by 4.1% in the first 11 months of 2000. Although this is good by regional standards, it still falls short of the 8-10% target that most banks set at the beginning of the year.

The main driver to loan growth has been mortgages, which have increased by 16% since the beginning of 2000 to account for 55% of total loan growth. The key beneficiary of the strong mortgage lending were Public Bank, which has mortgage exposure of over 20% of its loan book and 8% market share. Meanwhile, CAHB and Maybank control 10% and 15% respectively. Elsewhere, corporate loans have been weak, despite the capacity utilization rate hovering at 85% throughout the year, up from 76% at the end of 1998 and 85% at the end of 1999. Manufacturing loans, which account for 15% of total loans, increased by only 4% during the year, which is surprising given the high capacity utilization ratio of 85% throughout the year – this is the level at which corporates are likely to consider investing in machinery and equipment.

Looking ahead, we expect loan growth to continue to be weak and banks to struggle to achieve loan growth of 5-8%. However, the banks that are able to complete their mergers and the integration processes quickly will be well positioned to take market share in loans. Thus we believe that Maybank and Public Bank will benefit in this environment.

Interest rate outlook

The direction of interest rates in the U.S. will have little impact on local rates due primarily to the capital controls that were put in place in 1998. U.S. interest rates increased by 100 basis points in 2000, but the base lending rate (BLR) declined by 30 basis points over this period. BLR, is effectively set by the central bank by way of the intervention rate and statutory reserve requirements.

Malaysia has coped with a dysfunctional interest rate environment all year, whereby 3-month deposit rates (approximately 3.45% at the end of 2000) were 15bp higher than the corresponding interbank rates. Under normal market conditions where liquidity in the system is high and there is lack of meaningful loan growth, banks would set customer deposit rates below those of their corresponding interbank rates. However moral suasion from the central bank to maintain positive "real interest rates' on deposits has resulted in this dysfunctional interest rate environment, which penalizes banks that have highly liquid balance sheets with low loan to deposit ratios.

We expect the central bank to continue with its policy of maintaining positive "real interest rates" We are projecting inflation to remain benign at 2.8% in 2001 and only 3.0% in 2002 and as a result, we expect the central bank to maintain a neutral stance on interest rates.

94 January 8, 2001

Looking ahead, interest rates are expected to remain low as the economy is not relying on interest rate sensitive capital flows to support liquidity. Also, there is no need to slow the economy, which is still operating at well below full employment and inflation is still benign.

LEHMAN BROTHERS 95

MALAYAN BANK (RM13.80) 2-BUY

Lowering rating to 2-Buy

We are lowering our rating on the shares of Maybank to 2-Buy, which would be our only exposure in the sector. Maybank is the only bank in Malaysia not to record a share price decline in 2000 – it did not report a gain either as its share price ended the year at the same level as it started the year. However, on a relative basis, Maybank outperformed the KL Composite by 16%.

Although Maybank's merger plans are proceeding, we expect it, along with all the other banks, to experience integration problems. Integration, consolidation of branch networks and staff retrenchments are all key components of any successful merger. However, we believe that all three will involve significant expenses in terms of technology spending as well as staff severance packages. Thus, for any exposure to Malaysia, we would recommend Maybank.

The integration process will require additional expenditure on technology as well as staff retrenchment expenses. Consequently, the cost-to-income ratio is expected to increase to 34% in 2001, from 32% in 2000.

Bigger is better – size has its advantages. Size is one of Maybank's competitive advantages, and the recent mergers have not changed this as it will control a market share of close to 25% on all metrics, assets, loans and deposits, all of which are almost twice that of its nearest competitor. The competitive advantage is garnered through its extensive branch network of 421 branches combined with its relationship with the government, which together, has resulted in a core of cheap deposits.

Earnings growth to come from lower loan loss provisions Strong earnings growth will be attributed to lower loan loss provisions as core operations are expected to remain weak. After reporting loan growth of 5% in 2000, we project Maybank will improve on this and report loan growth of 8% in each of the following two years. However, this figure is dragged down by contraction in the region. Loans for use in Malaysia are expected to increase by almost 10% in 2001 and 2002, following 7.5% growth in 2000. The key driver to loan growth will be mortgages.

Superior asset quality and conservative loan loss reserve policy.

Maybank's lending policies have been prudent, resulting in the second best asset quality in the sector, behind only Public Bank. NPLs on a three-month basis were only 9.7% at the end of September 2000, well below the industry figure of 11.3%. Meanwhile, these NPLs are well provided for. The general loan loss reserve is equivalent to 3.6% of total loan and the reserve coverage of NPLs is close to 90%, both of which are better than even Public Bank.

COMMERCE ASSET HOLDING BERHAD (RM7.85) 3-MARKET PERFORM

We are maintaining our 3-Market Perform rating on the shares of Commerce Asset Holdings. These shares declined by 16% in 2000, which was in line with the performance of the KL Composite. However, in the second half of the year when merger problems became more apparent, the shares declined by 26%, underperforming the KL Composite by almost 8%. We believe further integration problems will continue to suppress sentiment towards this stock. In addition, there is also a negative overhang of stock being placed at a discount by Renong (since purchased by UEM) and New Straits Times, which together own 25% of shares outstanding.

Although Commerce Asset was the out of the blocks with its merger, it still has not been able to complete its merger. The key problem is trying to integrate the larger bank into the small one– Bumiputra Bank is twice as large as Bank of Commerce. The combined entity is the second largest bank in Malaysia, controlling approximately 15% of assets, loans and deposits.

Similar to the other banks, integration pains will result in additional expenses, resulting in a cost-to-income ratio of 48% in 2000, up from 35% in 1999. Management has indicated that the voluntary separation scheme to shed some 20% of staff will commence in June 2001, reducing headcount from 9,700 to approximately 7,800.

CAHB reported a NPL ratio of 13.4% at the end of June, equivalent to RM5 billion. Meanwhile, we are concerned about the bank's reserve coverage of NPLs, which is expected at only 32% by the end of 2000.

Core operations are expected to be weak. Our earnings model incorporates 10% loan growth in 2000 then increasing to 11% in each of the following two years – this may be aggressive, now that the merger is not going through as smoothly as first envisioned. The longer the merger process takes, the more management time and effort will be diverted from core lending operations.

PUBLIC BANK HOLDING BERHAD (RM3.08) 2-BUY

We are maintaining our 2-Buy rating on the shares of Public Bank and believe that its share price will recover following a terrible 2000, in which its share price declined by 25% and 22% on an 12-month and six-month basis, underperforming the index by 9% and 4% respectively. Public Bank has among the easiest mergers and should be able to concentrate on core lending operations ahead of other banks.

Public Bank has been able to take market share, increasing is loan book by almost 10% in 2000, versus market growth of only 4%. Key areas were mortgages, for which Public controls an 8% market share and accounts for over 20% of its loan book. Despite the strong top line growth, bottom line growth will be constrained by a higher tax charge in 2000 onwards.

Public Bank has the strongest balance sheet in the sector. Public has a tier 1 ratio of 18%, which is easily enough to carry out its merger as well as fund organic growth. Public Bank is proactively trying to gear up its loan book given the dysfunctional interest rate environment in Malaysia. Deposit rates are currently higher than their corresponding interbank rates. This means a liquid bank like Public Bank, which has a loan-to-deposit ratio of only 78% gets penalized. Public Bank has to put a portion of its deposit base into the interbank market and generate a negative spread. Thus we expect Public Bank it increase its loan-to-deposit ratio to 80% by 2001 and 83% by 2002.

Public Bank also has the best asset quality in the sector with a NPL ratio projected at 8.3% at the end of 2000. Public has always employed stringent lending criteria. For example, it only sold RM162 million in NPLs to Danaharta, which means that the peak level would have only been 12.6%, well below the industry peak of 30% (18% after sales to Danaharta). The bank is employing a more aggressive write-off policy, a luxury it can afford due to its high level of capital.

Coming out of the crisis, better capital management is needed. Its high level of capital is a drag on profitability as measured by ROE. Public has among the highest ROA's in the sector at 1.3-1.4%, yet its ROE is significantly below average at only 14%.

THAI BANKS

We continue to be aggressively **UNDERWEIGHT** the Thai banking sector, due primarily to poor fundamentals. While asset quality has improved during the year, balance sheet strength in general has deteriorated, as capital used to write down assets has not been replenished due to fleeing investors and widespread insolvency.

Our rationale against investment in Thai banks rests on the following key points:

- Losses are Not Yet Covered and Possibly Unknown: Known loan losses, even using banks' internal classifications, have yet to be provided for, resulting in substantial reserve underfunding. In addition, we believe that there are still unrecorded—and perhaps substantial—losses in the loan and securities portfolios.
- Pervasive Insolvency: Primarily due to reserve deficiencies, every bank in our Thai universe save for Krung Thai (post its extraordinary government bail-out) is insolvent, with capital shortfalls ranging from Bt10.0 billion at IFCT (1.02x capital) to Bt143 billion at Bangkok Bank (5.40x capital). These banks will all be forced back to market for capital at least once over the next 18-24 months.
- Insufficient Management Depth: Managements have shown little ability (and much resistance) to deal with the fundamental changes in their business, somewhat understandable given the severity of their asset quality problems. Nevertheless, the system is in need of experienced international banking managers.
- Growing Competition From Foreign Banks: Given the arrival of foreign banks on the scene (UOB/Radanasin, DBS/Thai Danu, Standard Chartered/Nakornthon, ABN/Bank of Asia), domestic Thai banks can not afford to remain an isolated pocket of inefficiency. The aforementioned foreigners all have deep pools of experienced lenders, marketers, and workout staff, and have the ability to spread technology and branding costs over much larger bases. In addition, they have access to capital and low-cost foreign currency funding which the domestic banks lack.
- Low Loan Demand: Loan growth continues to be negative, even with excess liquidity and low interest rates. Slowing growth in most of Thailand's major export markets will not help matters, and China's pending WTO accession will substantially increase competition in many of Thailand's main industries, further limiting growth potential.
- Weak Supervision and Accounting Standards: The BOT has repeatedly rejiggered standards to meet the banks' reported numbers rather than forcefully imposing them.

Investment Opinion

Specific Recommendations in the Sector

We do not believe that the government will allow any of the prestigious large banks (BBL, TFB, and SCB) to go under, whatever the cost, and in recognition of this we assign their local shares our highest rating within the sector (3-Market Perform), as we do shares of the quasi-governmental IFCT. Brief comments:

- SCB (Top Pick): In the best financial shape of the commercial banks, SCB also trades at a more reasonable 1.2x adjusted book (pre-reserve adjustments). Where the two classes of shares trade near parity, we would avoid the common in favor of the preferred shares, which are convertible 1-for-1 into common but which offer interim downside protection, especially in the likely event of additional capital-raising.
- BBL: The weakest of the large banks, we expect BBL to attempt to raise capital again soon. While additional capital, if obtainable, will improve the bank's balance sheet, it will also likely reduce or eliminate the foreign share premium, now at over 40%. Because of these near term downside catalysts, we rate the foreign shares only 4-Market Underperform, with the local maintained at 3-Market Perform.
- TFB: Healthier than BBL, but at a high valuation price—over 3.3x adjusted book value with no earnings in sight.
- Avoid financially weak and marginal banks like Krung Thai, Thai Military, and Bank of Ayudhya.

Government Aid is Necessary

State Assistance Moves Closer to Reality

The situation in Thailand cries out for immediate and meaningful government intervention, as the public sector would appear to be the only entity capable and *willing* to inject the necessary capital (we estimate total capital needs at Bt950 billion, or US\$24.4 billion) into the banks, particularly those with weak franchises. While the recent Krung Thai bailout is a good first step, Thailand must remediate the industry's problems on a systemic basis.

- Realization and Disclosure of Losses. It's been years since most of these borrowers stopped paying their loans, bonds, and so on. Yet we still don't know with any certainty what the real cost of this was. It's time to go through these portfolios, classify loans and other assets according to international standards, write off accrued accounts that will never be paid and worthless equity swaps, and total up the check.
- Removal of NPLs. Sheehan's Iron Law of Bank Management states that once bad assets pass 10%, management must spend at least 90% of its time dealing with restructuring, credit workout, litigation and associated capital-raisings. With Thailand not expected to reach this level for at least 36 months, this means that bankers will not have substantial time (or capital) to devote to rationalizing their core operations, refocusing their product lines around high-margin consumer finance, and improving customer service for approximately the same amount of time. Such a delay will be fatal to the industry. To have any chance of redemption, the banks must have their NPLs removed.
- Consolidation and Closings. There are too many institutions in Thailand given the poor loan growth and profitability. In addition, with foreign competition having established substantial beachheads in the market, there is little reason to assume that Thailand needs to generate all of its financial growth through domestic banks. We believe that the country could profitably support six to eight commercial banks given current economic conditions, rather than 14.
- Staff Reductions and Branch Closings. In line with bank closings, redundant and overlapping branches should be closed. In addition, existing branches should be relocated to better reflect changing residential and working patterns. To their credit, many banks are making these changes, at least on a small scale, opening smaller "kiosk" branches, and even placing branches on the platforms of the Bangkok Sky Train.
- Best Practice Accounting and Supervision. Thailand's accounting and bank regulation are both suspect. Thailand should harmonize its GAAP with international standards and enforce disclosure appropriately. Likewise, the Bank of Thailand needs to adopt a credible regime of supervision, examination, and enforcement. Regulatory forbearance is no substitute for capital adequacy.

■ Management Changes. In order to address serious current problems and upgrade the system for the future, Thailand needs to be importing talent aggressively from other industries and countries. There is not enough expertise within the system currently to overcome its problems and compete with foreign banks for domestic business.

Bank of Thailand Supervision

The Balancing Act Continues: Liquidity Prevents Systemic Failure

NPLs and negative capital are not the proximate causes of bank failure, although they are usually at the root of the problem. The real culprit is liquidity, and on this score the Bank of Thailand (BOT) and banks have acted brilliantly to maintain public confidence in the banking system. Despite the persistent level of technical insolvency in the Thai banking sector, the resultant high level of liquidity is preventing a string of bank failures. The BOT is well aware of this phenomenon and has not moved to close many of its large banks.

Instead, the BOT permits banks to survive provided they maintain a minimum CAR of 8.5% (Tier 1 capital of 4.25%) under its very loose interpretation, as well as the minimum step-up loan loss provision requirement.

Sham Restructurings and Phantom Equity

The BOT also continues to accept what we feel are questionable standards and disclosure around restructured loans and the nature of assets contained in a loan portfolio. A case in point: while all banks have claimed that they are not taking, or only taking, minimal haircuts in restructuring loans (leaving aside the material adverse NPV impact of lowering rates and extending maturities), delving into some typical restructuring methodologies reveals alarming and deceptive practices.

If a Bt100 billion loan is restructured, and the originating bank concludes that the maximum loan amount which could be serviced by the borrower, even at a reduced rate and on an extended repayment schedule, is Bt50 billion, the bank will commonly perform what officials have termed a "debt-for-equity swap" on the remaining portion of the loan. Rather than writing off the Bt50 billion which would appear uncorrectable, the bank will instead "swap" this amount of debt for an equity stake in the company. So far, we have no objections. Even though the stock should be worthless at the time of the swap (as the company has theoretically been loaded down with the maximum amount of debt it can conceivably service), it does in fairness represent a call option on the recovery of the firm, and is certainly better than nothing.

However, whereas in most countries this (usually unlisted and unmarketable) equity would be valued at zero until sold, and the Bt50 billion loan amount forgiven charged-off against reserves, in Thailand it is perfectly acceptable to the BOT to record the equity as Bt50 billion worth of loans – simply because it was exchanged for Bt50 billion of loans. Furthermore, this portion of the loan portfolio, although it is theoretically without current value, has no traded price or liquidity, and pays no dividend, is considered *performing*.

In this way, a Bt100 billion doubtful loan with 50% loss can be transformed into Bt100 billion in performing loans without changing the actual loss the bank will incur.

This structure is reminiscent of some of the more exotic derivatives strategies used by the Japanese banks to hide or postpone losses in the 80s and early 90s. We all remember how that ended.

Asset Quality

NPLs Continue to be a Problem

Asset quality remains extraordinarily poor, with average non-performing assets (criticized loans, other real estate, and excess accrued interest receivables) stubbornly high at 33.9% of loans, down from 45.4% at year-end 1998 and 43.6% at year-end 1999, despite the contention by the BOT that NPLs are rapidly coming off the books. Recently, several large banks have reported that NPLs are once again increasing.

Source: Lehman Brothers

As described above, we believe that many loan restructurings are not bona-fide workouts, but are primarily cosmetic in nature, and designed to reduce provisioning needs by removing loans from the non-performing roster. Our judgement is confirmed in that 6-10% of all restructured loans have already returned to NPL status, which implies that the estimates by bank management teams of at most a 15% NPL reversion over the remaining life of the restructured loans are optimistically low.

Particularly worrisome is the distribution of nonperforming assets among the classification categories. Fully 61.2% of all impaired assets are in the "Loss" category, which implies that there will be virtually no return from these loans. When combined with the "Doubtful" category, the most seriously categorized loans account for almost 67% of all nonperforming assets.

Collateral Clouds the Issue

Collateral values are basically meaningless if banks have neither the intention nor the ability to foreclose on their problem assets. However, since the BOT requires provisions on a net-of-collateral basis and not based on a borrower's willingness and ability to repay, we are forced to investigate collateral values. Despite the brouhaha surrounding the passage of improved bankruptcy laws in Thailand, Thai foreclosure laws have been left largely intact. Although this has meant that bankers are unable to foreclose on much of the collateral securing their NPLs, it has in some ways been a perverse blessing, as the lack of ability to seize and sell impaired collateral has kept the market from clearing at what we suspect would be a level significantly below that now assumed by banks for purposes of reserve adequacy calculations. Our reserve calculations (see below) are made gross of collateral, in line with international standards.

Reserve Adequacy

Thai bank reserves are not adequate to meet the actual losses contained within their loan portfolios. On average, we find that the banks have reserved against only 26% of their losses as currently identified by the banks' classifications themselves. This despite aggregate provisions of Bt645 billion in our covered universe since 1Q97. At the end of 3Q00, the aggregate reserve shortfall at our covered institutions was Bt552 billion, even after the Krung Thai recapitalization, which reduced NPLs by Bt537 billion.

Reserve Adequacy Calculation Methodology

We divide the Thai Banks' loan portfolios into the international standard categories of Pass (performing), Special Mention, Substandard, Doubtful, and Loss, with Loss comprising both the BOT's Doubtful of Loss classification and loans classified as Uncollectable. Note that this analysis accepts each bank's internal classification of their own loans, which we believe to be more lenient than the standards applied outside of Thailand.

We then apply reserve weightings as follows to determine the appropriate minimum level of required reserves: 1% on Pass; 5% on Special Mention; 20% on Substandard; 50% on Doubtful; and 100% on Loss loans. In addition, where not included in banks' internal classifications, we classify all excess (above 1.25%) accrued interest receivables and Other Real Estate (ORE, or foreclosed property) as Substandard. All assets are classified on a gross of collateral basis.

This is quite a bit more stringent than the BOT methodology, which is one of the most lenient in the world, but directly in line with the standards applied by the BIS and major regulators in the US and UK.

Capital

Short Supply and High Demand for Equity

All of our covered institutions—save for the essentially nationalized KTB—are insolvent by a wide margin when international standards of loan loss provisioning are taken into account. The Thai banks will continue to require large amounts of additional capital over the next two years in order to cover losses which, by and large, truly occurred years ago. It is not clear why investors have been willing to support these banks over the past three rounds of "final" recapitalization, but we are certainly suggesting that investors take a wait and see attitude when evaluating the Thai banks as a viable investment alternative.

We expect to see attempted share offerings from Bangkok Bank and Bank of Ayudhya early in the first half, with additional capital required at the other banks (with the possible exception of SCB and IFCT) during 2H2001. Given the current attitude of investors, its is difficult to assume that all banks would be able to access the required funding, and we foresee several failures among these attempted capital-raisings.

Upper Tier 2 Capital Looks Attractive to Banks and Investors

The Bank of Thailand has broadened its definition of bank capital to allow financial institutions to count additional classes of debt securities as capital, subject to certain restrictions. This move is in line with international standards, and should not in itself be considered a deviation from prudent supervision.

The new securities, which fall into a capital category known as *upper Tier 2*, are similar to existing subordinated debt issues (mainly counted as lower Tier 2 capital), but allow banks to defer paying interest under certain circumstances. Deferred interest is capitalized and must be paid, unlike the dividends on non-cumulative preferred stock, which counts as Tier 1 capital. Although these securities are bonds, the distressed nature of the Thai banks, along with the anticipated conversion features, make them trade more like equity instruments.

While upper Tier 2 will be ruinously expensive, and will hurt long-term earnings potential at the banks, we believe that the need for capital is so great that banks will be forced to accept what would in normal markets be considered unfavorable terms in order to continue operating. We believe that the major banks (BBL, SCB, TFB, and IFCT) will securely perform on these subordinated debt obligations, giving investors the potential for a very attractive return on UT2 securities—possibly combined with various forms of equity upside potential.

Earnings

Continued Losses in 2000 and 2001

Earnings continue to be poor, with our covered universe showing a collective loss in every period since 4Q97, and aggregate losses during this period of Bt577 billion. NPLs remain the problem, with foregone interest income on non-current loans and provisions against principal losses accounting for the vast majority of the difference between the Thai banks' theoretical earning power based on loan and deposit spreads versus the dismal actual performance.

Source: Banks and Lehman Brothers

While we do expect continued heavy provisioning burdens, we anticipate that the pace of reported losses will slacken as banks meet and pass the BOT's loan loss reserve guidelines for year-end 2000. Due to the overwhelming size of reserve underfunding compared with earnings, however, we will not be focusing overmuch on the reported bottom line numbers.

Poor Downsizing Efforts

Thailand is seriously lagging behind its Asian counterparts in bank restructuring, particularly in organizational downsizing. In Thailand, it is considered poor business practice to lay employees off. Reducing the heavy overhead burden, in our opinion, is one of the many areas the sector critically needs to address, as it would enable the banks to free up some costs to take the necessary provisioning. While banks are downsizing somewhat, it is coming at a very high cost with their early retirement schemes, which are prohibitive to a quick recovery. Krung Thai Bank reportedly looked into massive downsizing but found that it came under the State-Owned Enterprise Labor Law which prevents such a move. Further inhibiting recovery is the lack of in-market consolidation or the elimination of over-capacity in the market. This was a key ingredient to the U.S. bank recovery that we find would be very useful in expediting recovery in Thailand.

Competition

Market Share

The Thai banking market remains highly concentrated, with the top four banks collectively controlling 65% of assets and deposits. This percentage has increased in recent years due mainly to the growing balance sheet of Krung Thai, which has absorbed assets of Bangkok Bank of Commerce and First Bangkok City Bank during this time, offsetting a steady decline in Bangkok Bank's share of the market, which has fallen from 24.51% in 1997 to 21.88% currently – a decline in share of over 10%. Other large share losers include Thai Military (-10.3%) and Bank of Ayudhya (-8.9%). Share winners, aside from KTB (29.8%), have been Bank Thai (216.0%), Radanasin (26.8%), Bank of Asia (3.27%), and Siam Commercial (1.3%).

Branch Networks

Most banks' branches are heavily concentrated in the Metro Bangkok area and Central Thailand, with an average of 57% of the top four institutions' offices so located, and the remainder spread across the country, with an emphasis on the North and Northeast regions. Bangkok in particular is over-banked, with inefficient branches located too close to each other. Six banks have over 100 branches in Bangkok alone, with Thai Farmers operating the most at 158. By comparison, Citibank operates only 109 branches in New York City. The experience of Radanasin and Thai Danu seems to indicate that fewer branches are needed to provide adequate coverage of the city.

Branch and Staff Productivity

As you would expect from our ranking of the quality of their respective franchises, BBL, SCB, and TFB finish in the top tier when looking at per-branch and per-employee measures of productivity (as does IFCT with a surprisingly strong performance, even given its lack of deposit-taking operations and distinctly different clientele), while TMB and BAY lag.

Figure 33: Branch and staff productivity

	BBL	BAY	IFCT	ктв	SCB	TFB	ТМВ	Average

Valuation

Book Value and Adjusted Book Value

In order to compare Thai banks with the rest of our universe of Asian institutions, we have made a number of standard adjustments to the reported financial statements for valuation purposes.

Property Revaluation

First, we have deducted real estate revaluations from book value to arrive at adjusted book value. This account is not properly included in our calculation of adjusted book value for a number of reasons.

- Inferior Protection Against Losses. In the case of revaluation increment on bank property, such as branches and offices, actually used within the business, as opposed to that held for investment, the gain can not be realized without selling the property. However, this action is inconsistent with the valuation of the entity as an ongoing business, as the property is necessary to the conduct of business. Therefore, this capital is available only under a liquidation scenario. We bear in mind that scenarios under which banks are required to liquidate assets and capital in order to pay out liabilities are closely correlated with scenarios under which the value and ready liquidity of real estate can be expected to fall, due to general economic depression, panic selling, and unavailability of credit to finance the purchase of property. Therefore, real estate revaluation is available to serve as capital only so long as it is not needed, and so is less valuable than other forms of capital.
- Subjective Timing. Real estate is generally written-up at a time (and using a method) of management's choosing, and is rarely, if ever, written down. In addition, management frequently has wide discretion to select appraisers, and can "cherry-pick" appreciated properties from a portfolio that may have an aggregate loss.
- Included in Enterprise Value. The value contributed to the bank by its property is already subsumed within our estimate of the value of the bank's branch network, customer relationships and deposit franchise. This estimate of continuing enterprise value is the key factor that typically produces a "multiple effect" on bank valuations, causing them to trade at above book value. In this case, it would be double-counting that value to include property revaluation in our overall assessment of value.

■ Cross-Market Comparisons. Many jurisdictions, including the U.S. and Singapore, do not permit the use of property revaluation on the balance sheet, while others including Hong Kong, Indonesia and the Philippines do. Therefore, for purposes of comparability, we always include revaluation in our estimates and calculations of book value, grossing up reported book with revaluation if not reported as such within a particular jurisdiction, and we always subtract revaluation from our calculation of adjusted book value.

Loan Loss Reserves

Secondly, we have deducted loan loss reserve underfunding from adjusted book value to arrive at fully adjusted book value, which is negative for all of our covered Thai banks. This allows us to compare institutions within the market and across markets based on their underlying economics, and not on the timing of provisions or loss recognition, which is highly variable at management's discretion. As fully adjusted book is negative and thus a price-to-fully adjusted book measure not meaningful, we have presented only price-to-book and price-to-adjusted book throughout this report.

With our normal value touchstones in distressed markets – price-to-book and price-to-adjusted book – rendered less-than-accurate by the dominating effect of reserve underfunding, we have begun to compare the banks from a deposit premium standpoint.

Under this methodology, we subtract fully adjusted book value from market capitalization to determine the value in excess of net assets that the market is placing on the bank's franchise. When expressed as a percentage of total deposits, this valuation methodology confirms our view that the Thai market should still be avoided on valuation terms, with an average deposit premium of 20.4% standing out as rich compared with less-distressed markets. This despite an average price decline of over 60% in Thai bank share prices last year.

BANGKOK BANK (BT38.00) 4-UNDERPERFORM (F)

Investment Summary

Bangkok Bank (BBL) is Thailand's largest publicly-owned commercial bank, and has historically been perceived as the country's leading financial institution. For this reason, we find it unlikely that the bank will be allowed to fail, particularly as it has been able to make full provisions under the BOT standards for year-end 2001. However, the bank is weaker than many of its large competitors, and unattractive from a valuation standpoint, even though it may be permitted to operate indefinitely from an insolvent position.

We rate the foreign shares as 4-Market Underperform and the local shares as 3- Market Perform.

Key Points

- Beware False Profits: BBL trumpeted its return to reported earnings in the second and third quarters after eight straight quarters of losses—but these earnings are not real. Underprovisioning and securities gains have permitted the bank to record bottom line profits, but on an operating basis the bank remains unprofitable. BBL will not be able to restore its capital base or make appropriate provisions through earnings in the foreseeable future.
- It's the Bad Assets: For all the attempts to spin the results, restructure loans at off-market rates, and present an improving picture, Bangkok Bank remains at 28% net NPLs/Loans, more than three years into the crisis. Staggering provisions of Bt178 billion made during this period are almost completely gone, with current reserves totaling less than Bt18 billion.
- Reserves are Inadequate: By our model, BBL requires additional loan loss provisions of Bt170 billion—equivalent to all the bank's remaining capital 6.4x over. Current reserves cover only 9% of our required amount.
- BBL is Counting on 85% Recovery: For the bank to be solvent at its disclosed level of NPLs (which we consider to be low), it will need to achieve 85% recovery on all NPLs—an unprecedented level. Our model estimates a 22% NPV recovery, while the recent Thai Danu sale of an NPL portfolio at 27% of face value would seem to confirm that real recoveries will be much lower than the level required to preserve capital at BBL.
- Capital is Badly Needed: BBL is insolvent by a substantial margin, and urgently needs a capital infusion to make provisions and keep operating. While management has been window-dressing the results in order to facilitate another round of equity issuance, investors have thus far evinced no interest. We believe that any offering would have to be done at a punitive discount—another reason to avoid the shares, particularly the overvalued foreign shares.

■ Only a Political Solution Will Save the Bank: We continue to believe that the Thai banks require immediate and meaningful government intervention, as the public sector appears to be the only entity capable of injecting the necessary capital into the banks, particularly those with weak franchises. If BBL gets a Krung Thai-like solution, it may yet preserve its market position. However, while we believe that the government will save the bank, it's a stretch to assume that it will bail out existing investors as well.

BANK OF AYUDHYA (BT5.40) 4-UNDERPERFORM (F)

Investment Summary

Bank of Ayudhya (BAY) reported a profit of Bt387 million for 3Q00, its first after eleven consecutive quarterly losses. However, the bank was unprofitable on an operating basis, and the profit was caused by negative provisioning. As BAY's reserve remains severely underfunded, we do not agree that the writeback was warranted or prudent, and by our measures the bank continues to be significantly insolvent.

We believe that BAY will not survive as an independent entity without material government aid. The bank now appears fair game for one of the smaller foreign-owned banks like Bank of Asia or Radanasin, but is still overpriced given its weak franchise and distressed balance sheet.

Key Points

- Margins Falling: Net interest margin is now only 1.27%, down 53 basis points from 1Q00. NIM compression has come primarily on a precipitous fall in earning asset yield, which shed 37 b.p. in 3Q alone. BAY appears to have reached a floor in terms of funding costs, with cost of funds lagging benchmark rates on the downside.
- Asset Quality: The bank has written off Bt30-40 billion in bad loans since 1Q, although NPLs remain high at 31% of loans. What is disturbing is that the severity of NPLs began to creep up again in the third quarter, with Substandard, Doubtful, and Loss loans increasing while loans in the least-severe Special Mention category decreased.
- Provisions and Reserves: BAY wrote-back Bt845 million in provisions in the quarter, which leaves us scratching our heads. By our calculation, BAY needs reserves of Bt73.8 billion and has existing reserves of only Bt8.9 billion (down from Bt32.4 billion at 1Q due to the depleting effects of NPL write-offs), leaving a shortfall of Bt64.9 billion, or 4.5x capital. Negative provisioning under these circumstances is negligent.
- Capital Raising: Bank of Ayudhya officials have received shareholder approval to raise additional capital, a necessity given the bank's thin equity base of 3.2% of equity and under-reserved position. Given an issue of the maximum number of new shares (3.7 billion), plus conversion of all 1.7 billion approved warrants into shares at the current market price, BAY would raise only Bt30 billion-a substantial sum, but one not sufficient to provisioning needs of Bt65 billion.
- Valuation: While BAY is trading at 80% of stated book value, its adjusted book value is strongly negative given the low level of reserves. With the bank expected to continue to lose money throughout FY2001 and FY2002, we find the stock unattractive, and maintain our 4-Market Underperform rating and Bt5 price target.

INDUSTRIAL FINANCE CORP. OF THAILAND (BT5.70) 3-MARKET PERFORM (F)

Investment Summary

Set up by a special act of Parliament, Industrial Finance Corporation of Thailand (IFCT) is Thailand's only development bank. Its main objectives are to assist in the establishment and modernization of private industrial enterprises.

IFCT reported its earnings for 3Q00, showing a recorded loss of Bt498.6 million, or Bt0.43 per share, in line with our estimates. While this compares favorably with 3Q99's loss of Bt1.3 billion (Bt1.14/share), the quarter's loss outpaced that of 1Q and 2Q combined, even though IFCT made negligible provisions for bad debts in the period. These results show an institution still in deep structural trouble on an operating basis.

While the bank, like all of the Thai banks in our universe (ex-Krung Thai), is insolvent if appropriate reserves for loan losses are applied, having made 100% of the BOT-mandated loan loss provision and with an implicit government guarantee, IFCT does not appear to be in any near-term difficulty as regards liquidity.

Key Points

- Rates and Margins: IFCT continues to have a negative net interest margin. While the bank's cost of funds has steadily fallen, earning asset yields have failed to make up the slack. A good portion of the negative NII is due to foregone interest income on IFCT's substantial NPL portfolio. However, even if we assume a foregone interest margin of 6% on all classified assets, foregone interest income of Bt466 million would not suffice to restore NII to positive territory. We suspect that two additional factors—loan restructurings and depressed yield on impaired securities—are combining with foregone interest to render the bank unprofitable:
- Asset Quality: IFCT continues to be plagued by NPLs, which now account for 26.3% of total loans. While this has declined from the 2Q99 peak of 42.1%, it remains a serious concern. Existing reserves are inadequate to support identified NPLs, totaling only 35% of our required reserve of Bt30 billion. The shortfall is equivalent to 2.0x IFCT's remaining capital base, leaving the bank insolvent.

In addition to these impaired assets, IFCT continues to have an excessive and unsupportable amount of accrued interest receivable (AIR), more than three years into the crisis. AIR of Bt5.9 billion exceeds 4% of total loans, which is well above even the year-end 1997 level. The poor quality of this asset should be reflected, in our opinion, by reversing AIR through NII. In the meantime, it is perfectly reasonable to consider all IFCT's AIR as at least a substandard asset, which would require an additional Bt1.2 billion in provisions.

While this paints a bleak picture, IFCT is generally well-positioned relative to its commercial bank peers in its collateral coverage of loans, as management has been more conservative in assessing appraised values, as well as in their maximum loan

commitments to appraised values. IFCT will typically haircut collateral value by 40%-50% of appraised value, lending only 70%-80% of the adjusted value. In addition, the bank has historically been a cash-flow based lender versus mainly collateral-based lending by the commercial banks. With borrowers' assets difficult to repossess in Thailand, this has made a large difference in write-offs to date.

Symbiotic Relationship With the Government

IFCT, under the Industrial Finance Corporation Act of 1959, is entitled to certain benefits as a specialized financial institution, as follows:

- Implied Government Guaranty: IFCT does not accept deposits and primarily funds itself though debentures and long-term bonds. While certain obligations are guaranteed by the Ministry of Finance (MOF), the overall government ownership position of IFCT implies a government guarantee even for external borrowings that are not explicitly backed, thus producing a lower cost of funds.
- Concessional Lending: IFCT is a direct beneficiary of the government's channeling of concessional loans to specialized finance institutions that will alleviate the liquidity problems of the industrial and SME sectors. Borrowing rates from the government are, of course, below market. IFCT historically has been a recipient of concessional loans from foreign development banks, as well, including the World Bank, Asian Development Bank, the Export-Import Bank of Japan, and various European development banks. In the past year, IFCT has received Bt3.5 billion from the Overseas Economic Cooperation Fund of Japan, US\$25 million from the Netherlands Development Co. and US\$45 million from Kreditanstalt, a German development bank.
- Special Tax Exemption: IFCT is not subject to corporate income tax and is exempt from paying business taxes and stamp duty. This factor alone enables stronger earnings and ROEs compared to the commercial banks.

KRUNG THAI BANK (BT11.75) 4-MARKET UNDERPERFORM (F)

Investment Summary

At long last, the government has completed the bail-out of Krung Thai, the country's most troubled bank. The FIDF purchased Bt537 billion in troubled loans from Krung Thai, in return for interest-bearing government bonds. The bank was then able to write-back Bt108 billion in reserves held against the NPLs, which was used to repurchase the government's preferred shares in the bank. We consider the Bt108 billion write-back an extraordinary gain, which explains the discrepancy between core and net earnings for FY2000.

The government also received warrants to purchase 10.8 billion preferred shares at par; we continue to look at Krung Thai on a fully-diluted basis assuming eventual conversion of these shares.

Post asset transfer, Krung Thai is now solvent—the only Thai bank which can make such a claim under our methodology. Reserve underfunding of Bt51.8 billion is only 78% of capital, leaving the bank with positive equity even after making allowances for impaired assets. However, the residual institution will still have difficulty returning to normal operation, with its franchise seriously eroded.

Key Points

Asset Quality Still Poor: Krung Thai's NPLs fell from Bt658 billion in 1Q00 to Bt132 billion at 3Q00, with net non-performing assets dropping from Bt432 billion to Bt94 billion over the same period. Although this is an excellent result (albeit one produced solely by government intervention and not by business improvement), NPLs to assets are still high at 13.3%, leaving KTB a lot of work to do.

In addition, we note with approval that accrued interest receivables fell to 1.95% of loans from 4.38%. Although the amount is still out of line, it reverses an adverse trend dating back to 1Q96.

- AMC: KTB's bad assets—substantially all loans delinquent for at least one year—were purchased by the Financial Institutions Development Fund, which has set up Sukhumvit AMC, an Asset Management Company to manage these bad assets. The bad assets include former loans of First Bangkok City Bank, which was forcibly merged into KTB in 1998. Krung Thai has no ownership of or continuing responsibility for the assets in the AMC.
- NPL Transfer Funding: Sukhumvit is primarily funded by loans from Krung Thai, which are fully guaranteed by the government. The notes given to KTB pay interest equivalent to the average savings rate paid on the banks deposits, plus the FIDF bank tax charges on income. In essence, KTB is making a zero-margin five-year loan to the FIDF of Bt313 billion, or 32% of the bank's assets.

- Reserve Adequacy: Current reserves of Bt52 billion are still inadequate, with our estimate of required reserves now standing at Bt103 billion, implying a shortfall of Bt52 billion, or 0.78x remaining book capital. The government purchase plan lowered NPLs, but also depleted reserves, leaving post-recap coverage at 50% of required reserves with NPL coverage of 35%.
- Ownership: Krung Thai remains overwhelmingly controlled by the government. Among the FIDF, Ministry of Finance, and various other state entities, collective KTB ownership is currently (i.e., not including warrant conversion) over 92%, which will limit trading float and index inclusion. Foreign ownership is less than 4%.
- M&A Potential: As KTB is now solvent, it could make an attractive strategic partner for a foreign bank looking to enter the market; however, we doubt a near-term deal for a variety of reasons: First, the bank has poor management even by the standards of the sector, so that any partner would presumably insist on management control.

Second, the sheer size of the bank—~\$22.5 billion in assets—would require a substantial commitment of risk assets to Thailand. Only a few global banks could possibly do such a deal, and most either have existing Thai operations or have passed on the opportunity to acquire same. Finally, the Thai government's track record in selling banks is mixed at best, and we doubt that they would be willing to place a realistic value on the government's stake in the bank.

In-market consolidation could make sense as a way for KTB to improve its float and acquire a better management team, IT platform and brand name, but government opposition to cost saves and consolidation of operations could easily nix this option. We see it more likely that the government will use Krung Thai as a vehicle to absorb other failed banks under government supervision, such as Bank Thai.

SIAM COMMERCIAL BANK (BT20.50) 3-MARKET PERFORM (F)

Investment Summary

Siam Commercial Bank has continued to show marginal profits, with 3Q00 results representing an annualized ROAA of 0.43% and an ROAE of 6.06%, remarkable only in the severely depressed Thai market. While the earnings result was anemic, we continue to feel that SCB is the healthiest of the major Thai banks, with a relatively reasonable valuation to boot.

Investors have been justifiably sceptical about the stock due to fears that SCB is more aggressive than the other banks in valuing collateral against its loans; however, we stress that our book adjustment and reserve adequacy calculations do not take into account collateral values, and yet have still shown SCB to be healthier than its top-tier peers in previous quarters—we must await the detailed earnings release to see if this continues to be so.

Key Points

- Margins: SCB's margins are among the best in the sector, although they contracted in the last quarter, with net interest margin falling by 15 basis points to 2.26%. However, the bank showed a continued reduction in accrued interest receivable, which depressed interest income, as management elected to reverse excess AIR through the interest income accounts rather than write it off against reserves.
- Book Capital is Adequate: Having completed its last public offering and recapitalization in mid-1999, SCB has sufficient capital at 7.6% of assets for operations, which it has bolstered with small profits in each of the last five quarters. SCB is under no immediate pressure to make additional provisions, as it meets the BOT standard, and should be able to manage the timing of further capital raisings accordingly.
- Reserves: The bank continues to be under-reserved and insolvent. We estimate that SCB requires additional reserves at 3Q00 of Bt85.3 billion, or 1.6x capital.
- Preferred Dividend: The SCB preferred shares pay a dividend of 5.25% on the original issue price of Bt26.00; however, this dividend is only payable if SCB is a) profitable during the period; and b) does not have accumulated losses. The dividend is non-cumulative, so that the dividend for any period in which these conditions are not met is permanently lost. This dividend is payable through May of 2009, at which point the dividend becomes equivalent to the yield on regular common shares. SCB must pay preferred dividends in full before it can pay anything to common shareholders.

THAI FARMERS BANK (BT23.50) 3-MARKET PERFORM (F)

Investment Summary

TFB has fallen back into the negative profit zone as of 3Q00, having seemingly run out of the smoke and mirrors accounting sleight-of-hand which boosted earnings into putatively profitable territory in 1Q and 2Q.

TFB remains underprovisioned by Bt103 billion on a consolidated basis, equivalent to 406% of remaining capital, leaving the bank insolvent even as capital continues to dwindle. Total and Tier 1 CARs under the Thai methodology now total 11.73% and 7.07%, off 46bp and 30bp respectively despite declining risk-weighted assets.

We believe that TFB is under pressure to report a turnaround in order to clear the decks for an equity offering, which will be necessary within the next 12 months. Even at current depressed valuations, we believe that TFB is poor value, although we believe that the bank will survive.

Key Points

- Rates and Margins: Net interest margin improved to 2.17% in the quarter, slightly above the 2.13% earned in 1Q00 but well below our 2.44% forecast. The cost of interest-bearing liabilities continued to fall, dropping by 9 basis points, to 3.70%, while yield on earning assets (primarily loans) ticked up by 3 basis points to 5.77%. Weak net interest income remains depressed by NPLs and low-rate restructured loans.
- Provisions: TFB has made no loan loss provisions thus far in FY2000. As TFB's gross consolidated reserves total only 34% of what we would consider an adequate level, this is far from defensible. We believe that TFB should have taken a Bt2.5 billion charge for provisions in each quarter of the year, which would have allowed the bank to reach 50% of our required reserve level by 4Q01—a minimal standard.
- Asset Quality: Criticized loans fell to Bt 180 billion from Bt190 billion, leaving the ratio of non-performing assets (NPAs) to total loans at 39.3%—flat from 2Q00. Loan loss reserves fell by some Bt20 billion, indicating that real asset quality is still deteriorating.
- Capital Position and Fund Raising: Thai Farmers completed several capital raising transactions during 1999, and in consequence has been able to maintain a respectable capital level for longer than some of its peers. However, even the cosmetic profit just reported did not keep capital from falling to Bt25 billion from Bt32 billion in the previous quarter. At approximately 3.3% capital/assets, TFB's capital level is still high enough to sustain additional losses without requiring near-term replenishment, but low enough that the bank will need to add equity by next year in order to continue writing-off bad loans.

THAI MILITARY BANK (BT5.70) 4-UNDERPERFORM (F)

Investment Summary

TMB has not reported a profit since 3Q97, and we expect continued losses through year-end 2001. Even after the painful and punitive share offering TMB undertook during 2Q00, which raised almost Bt30 billion, the bank remains insolvent by a multiple of its capital and is unprofitable on an operating basis.

The bank's survival is now in jeopardy, with prospects for another offering to boost capital dim. Management has indicated their willingness to sell up to 100% of the bank to a domestic or foreign bidder (presumably having discussed this with the Bank of Thailand), but the under-funded loan loss reserve makes TMB an expensive franchise even as its stock price approaches zero.

Key Points

- Capital Raising: At the end of 1Q00, TMB had minimal capital of Btó billion, or 1.8% of assets. During 2Q00, TMB raised an additional Bt30 billion in capital by issuing 996 million common and two billion Class B convertible preferred shares, resulting in 3Q00 equity of Bt13.6 billion-a barely-adequate 4.0% of assets. The bank will require additional capital within the next 18-24 months; it is certainly difficult to imagine investors sinking additional funds into this franchise.
- Asset Quality: Asset quality remains poor, with non-performing assets still totaling 42.0% of total loans. TMB's reserve is underfunded by Bt58 billion, or 4.2x remaining capital. Criticized assets have declined only marginally since the extraordinary write-off of the second quarter, and we would not be surprised to see them begin to creep up again.
- Potential Merger: The possibility of a merger with finance and securities company National Finance PCL has been raised by NFS' subscription to the TMB share offering through its Ekachart Finance subsidiary. An acquisition of TMB by National Finance would give the latter control of a full banking license for the first time, long a corporate goal. NFS had its application to upgrade Ekachart from a finance company license to a restricted bank license pending before the BOT for some time before the TMB recap, and it could be that the central bank forced NFS to prop up TMB as the price of access to a bank franchise.

INDONESIAN BANKS

It has been another punishing year for Indonesian bank stocks, with the average of our coverage universe down over 45% even in rupiah terms, despite the 18% gain posted by Bank Central Asia (BCA) post its June listing. While we remain **UNDERWEIGHT** the sector, significant progress in certain areas bears notice.

At the end of 1999, the weightiest arguments against investment in Indonesian banks were institution-specific: virtually all banks were massively insolvent and losing money on an operating basis due to negative net interest income. Asset quality was extremely poor, with the worst banks having NPLs exceeding a staggering 90% of total loans. Serious questions abounded about the government's ability to recapitalize banks, remove impaired assets and force consolidation.

Against long odds, these caveats have been largely eliminated for the moment, with NPAs to Assets at banks in our coverage universe now totaling 11.7%, versus the Thai commercial bank average of 23.4%. The major public Indonesian banks (BCA, Lippo, Panin) are at least healthy enough to be able to make strides in restructuring their operations—closing underperforming branches, improving information technology, and repositioning what was largely a process culture as a customer-focused sales effort.

Key Investment Factors

Under-levered Balance Sheets. Commercial bank assets in Indonesia are currently up to 80% government recap bonds, which produce little spread and are not easily saleable at par. The ability of banks to improve their spreads depends on their ability to find creditworthy borrowers and make high-margin loans.

Negative Loan Growth. After the rapid credit expansion during the early 1990s (24.3% per year between 1992 and 1996), loan growth in Indonesia has turned strongly negative since the crisis. A return to corporate loan growth will depend on how quickly corporate debt restructuring takes place. Meanwhile, most banks are focusing on lending to small businesses and consumers, similar to the strategy of good Korean banks.

Consumer Lending is Key. There are tremendous opportunities for banks to lend to the retail customer in Indonesia. Until now, the retail customer has been viewed merely as a source of deposits to fund the ambitions of the banks' owners. Now, however, the retail lending market appears quite attractive, as it should offer the banks loan diversification with relatively low risk. However, with virtually all banks having identified this as their target market, there exists substantial risk of uneconomic pricing and/or poor credit decisions.

Foreign Competition is Rising. Foreign banks are in Indonesia to stay. While most banks were just gaining a foothold when the crisis hit, and many almost completely curtailed their lending activities, they have nevertheless gained substantial deposit market share even while paying sharply lower rates. As these banks have long serviced

Indonesia's wealthy from offshore and have a substantial advantage in providing foreign currency loans to Indonesia's remaining prosperous corporations, foreign banks will soon be in a position to compete for most large corporate credit relationships. We expect that the next step for these banks will be to acquire domestic institutions in order to gain the required scale to tap the consumer market.

Inexperienced Credit Officers. Bank credit officers mostly lack the expertise required to evaluate the credit-worthiness of borrowers. Many were reared in the pre-reform environment, where credit analysis was a minor issue in extending a loan. As elsewhere in Asia, the main criteria for lending were the availability of collateral, primarily land, and the borrower's connection with bank ownership. This, when coupled with the desperation of banks to put on profitable loan assets, leaves Indonesia vulnerable to another asset quality crisis.

Poor Supervision. The central bank has a poor record of supervision, and its credibility is meager—Bank Indonesia's Governor is under indictment and has spent a good portion of the second half under police confinement. A majority of the other board members have resigned due to their unhappiness with the slow pace of reforms. Meanwhile, BI's accounting remains impenetrable, although it seems undisputed that the institution is insolvent by several billion dollars.

Investment Opinion

Specific Recommendations in the Sector

Due to the low volume of trading in Indonesia, we formally cover only the three most significant publicly-traded institutions: BCA, Lippo Bank, and Bank Pan-Indonesia (Panin). Note that while other banks such as Danamon, Bali, and BNI remain theoretically listed, the government owns in excess of 99% of the shares in each, and trading is virtually non-existent.

Our key area of focus for investment remains the consumer market, which has historically been ignored by domestic banks, and which is less subject to macroeconomic trends if properly managed. We also see exciting opportunities in domestic M&A, with the overcapitalized good banks able to solidify their positions by consolidating the remaining 70-odd small Category "A" banks and weak Category "B" banks.

- Bank Central Asia (BCA)—Our Top Pick: We continue to believe that BCA is clearly the premier institution in a troubled market, with substantial remaining upside. After IBRA's restructuring and financial assistance, BCA has a pristine balance sheet, solid capital base, and leading position in the lucrative consumer market. At 0.8x book value (1.4x adjusted book value) and 4.7x FY2000 EPS estimates, BCA is also among the cheapest stocks in the sector. The bank is our only 1-Strong Buy in Indonesia, and we recommend that investors limit any Indonesian exposure to BCA.
- Lippo Bank: Lippo is a medium-sized but dynamic player with a strong brand name, well-positioned branch network and retail customer base, and savvy marketing ability.

While capital is still relatively thin, and the bank maintains a higher-than-prudent amount of impaired assets on its books, we believe that Lippo will continue to outperform its peers in 2001, and so rate the bank a 2-Buy.

Panin Bank: Panin was the only significant bank in Indonesia to be rated a Category A bank under the bank recapitalization program implemented by IBRA, a recognition of the bank's relative financial strength and historic conservativism. However, Panin remains beset by asset quality difficulties and we have reservations about the bank's strategic direction, as typified by the bank's decision to re-orient efforts towards the consumer banking market. Additionally, Panin's recent special dividend of Rp40 per share appears imprudent to us. While Panin's valuation is particularly attractive on a price-to-book basis, we nonetheless find the market and management risk permits us to rate the shares only as 3-Market Perform.

The Economics of Slow Growth

Deteriorating Economy Limits Corporate Banking Upside

While we have pointed to some positive signs, the once-promising sectoral macro environment has deteriorated seriously, and still argues against significant foreign investment in the banking sector. IBRA's program has been slowed by political infighting and by the replacement of two Chairmen (and many other executives) during the year. The Bank Bali scandal and indictment of Bank Indonesia's Governor (who remains in office as of publication date) have cast a pall over market confidence in government institutions, and approval for the Wahid administration has fallen both internally and externally.

These factors have contributed to slowing GDP growth, even as Indonesia was one of the only Asian countries to benefit from higher oil prices. With banks underlevered and government bond spreads relatively low, the bank sector will need substantial growth in order to generate loan originations and convert now-strengthened balance sheets into robust income statements.

The China Syndrome

A factor of unknown but potentially significant magnitude will be China's pending WTO accession. Should China gain full WTO privileges, its low-wage manufacturing will encroach on much of Indonesia's industrial and export base. Given the lure of China's large domestic market and its government's investment-friendly policies, we expect that Indonesia will lose investment to its larger neighbor.

Consolidation Is Underway

Indonesia had the most unwieldy banking system in Asia, with 239 banks in operation prior to the crisis. The large number of banks in Indonesia put competitive pressure on managers to make riskier loans. In a sense, the counterparts of banks in Indonesia were the finance companies in Thailand, most of which had to be closed by the Thai

government in 1997. The sector has been rationalized somewhat, down to 164 banks, but is still vastly overpopulated.

Figure 37: Indonesian Financial Institutions: End 1996 Versus Today

End 1996	Actions Taken	Current Status
Seven State Banks	Merger of four State Banks into Bank Mandiri	Four State Banks
164 Private Banks	72 banks closed	72 "A" surviving banks
	13 banks taken over (BTO)	20* banks in the rehabilitation
	Nine banks recapitalized	process
41 Joint Venture/Foreign	Three banks closed, three	41 Joint Venture/Foreign
Banks	banks opened as a result of	Banks
	Foreign investment	
27 Regional Gov't Banks	No action to date	27 Regional Gov't Banks
239 Total Banks		164 Total Banks

Two banks have both BTO and Recapitalized Bank status.

Source: Lehman Brothers

As is evident from Figure 38, a good portion of the consolidation was involuntary. Of the top twenty banks in the country on the eve of the crisis, eight have been closed or forcibly merged into other institutions, including five of the top ten.

Indonesia's banking system is now dominated by a few large banks, with four of the top five completely (99%+) government owned, and the fifth (BCA) majority controlled by IBRA. Post-IBRA recaps, the rural and regional government banks have become increasingly irrelevant, and will probably either consolidate or disappear. Likewise, the overwhelming majority of private banks do not have the scale to thrive under Indonesia's new supervisory regime, and will be at increasing disadvantage when competing against large national banks. We expect this to lead to a consolidation which will eliminate most if not all of the smaller institutions.

Recapitalized

Closed

LEHMAN BROTHERS January 8, 2001 137

Bank Universal

Bank Indonesia Raya (Bank Bira)

With government entities making no secret of their desire for fewer, larger banks, we expect to see minimum capital requirements rise sharply in the next few years, similar to the path taken by the Philippines. This, along with an initially low loan growth environment, will provoke more strategic mergers, with the market eventually making room for 10-15 large banks and a like number of niche players.

Flight to Quality Continues to Favor Scale

We expect that the remaining large banks will continue to increase their collective share of the market as consolidation further reduces the ranks of Indonesian banks. Any further volatility or uncertainty will benefit those institutions seen as dominant and stable. In addition, the 'A' banks, formerly the most prudent and safe organizations, are now significantly more distressed than are the huge banks that failed, as their balance sheets have not been swept clean by IBRA and they are capital constrained.

Bank Supervision

Indonesia has introduced a number of reforms to strengthen the banking system, although confidence in bank supervisory agencies has if anything slipped this year due to ongoing turmoil at the central bank. Bank Indonesia is now the primary government body overseeing the banking system. Prior to this, the banking system was also supervised by the Ministry of Finance. These reforms include the following:

- All directors and commissioners of a bank must pass a "fit and proper test" performed by Bank Indonesia prior to being appointed. Directors are not permitted to become directors of or hold executive positions in other companies or banks while they serve as directors of commercial banks.
- Banks are required to maintain a minimum capital adequacy ratio of 4% of risk weighted assets, to be increased to 8% by the end of 2001. Total capital includes both Tier 1 and Tier 2 capital. BI's uses the BIS methodology to calculate risk-based capital ratios.
- Banks cannot extend credit of more than 30% of capital to non-affiliates, 10% to affiliates and 10% to state-owned enterprises. Affiliates are borrowers connected with the bank through share ownership or directors.

- A minimum of 80% of foreign exchange loans must be made to export-oriented companies.
- The maximum net open foreign exchange position allowed is 20% of capital.
- Banks are required to maintain a loan to deposit ratio of less than 110%.
- Foreign investors are now allowed to own up to 99% of the shares of an Indonesian bank.
- Banks are required to classify the assets in their portfolio in one of five categories and required to maintain minimum loan loss provisions.

Indonesia's Recapitalization Process

Classifying the Banks by Capital

To begin the process of bank restructuring, the government decided in June 1998 to have international auditors determine the solvency of Indonesia's banks based on international banking standards. Upon completion of this solvency test, Indonesia's private banks were placed in three different categories based on their capital adequacy ratios, as detailed below:

- Category A Banks. With CARs above 4%, these banks were considered sufficiently capitalized so as not to require additional funds from the government. They can continue operations without government interference. Into this category fell 73 banks.
- Category B Banks. These banks, with CARs between negative 25% and positive 4%, were eligible for recapitalization, provided that they met certain criteria.
- Category C Banks. Banks with CARs of less than negative 25% were given 30 days to meet the capital requirements to become Category B (subject to the same criteria for recapitalization) or face closure.

Recapitalization Eligibility

The recapitalization program for private sector banks was carried out only on selected banks. This selection process consisted of first classifying the banks into A, B, and C categories and then conducting further appraisal on the Category B Banks. Eligible banks had to establish their viability by submitting a rehabilitation plan and subjecting management and owners to a "fit and proper test" by IBRA and BI and settling all intragroup loans exceeding the legal lending limit. Based on the results of this appraisal, bank selection was carried out as follows:

Category B Banks that passed the further appraisals and whose controlling shareholders were willing to contribute a minimum of 20% of the total recapitalization cost as of December 31, 1998 were entered in the private sector bank restructuring and recapitalization program.

- Category B Banks that passed the further appraisal but whose shareholders were unwilling or unable to participate in the recapitalization were taken over by the government (banks taken over or BTO).
- Category B Banks that failed to pass the appraisal had their operations frozen (BBKU), except for banks with more than 80,000 depositors (BCA and Bank Danamon), which were considered too big to fail and taken over by the government. Subsequently, Bank Niaga and Bank Bali, both initially Category B, were taken over and recapitalized when their controlling shareholders failed to participate in the recapitalization process.

Recap Mechanism

In undertaking a recapitalization, the government entered into an Investment Agreement with the bank and its controlling shareholders. The principal provisions of this agreement were as follows:

- The controlling shareholders pledged their willingness to participate in the recapitalization, with a minimum investment of 20% of the recapitalization needs as of December 31, 1998.
- The government agreed to fund the remaining recapitalization needs as calculated by an independent public accountant, in cooperation with the bank's shareholders. Recapitalization funds would be injected primarily in the form of government bonds (see below).
- The bank would transfer all Category 5 (Loss) loans to IBRA, with the exception of loans with principal balances of less than Rp5 billion.
- The bank would repay liquidity assistance and correct any legal lending limit violations within one year.
- The bank agreed to comply with financial and operational targets set out in the business plan, and to submit periodic progress reports.
- IBRA agreed not to participate in the day-to-day management of the bank.

IBRA recapitalized seven private sector banks through the issuance of government bonds and become a shareholder in these banks. Public participation in the recapitalization of these banks has exceeded the minimum 20% requirement, reducing the government's ownership so that it has an average of 63% ownership, versus the 80% originally forecast.

Bank	Recap Cost (Rp Bil.)	Gov't Injection (Rp Bil.)	Ownership
Bank Internasional Indonesia	11,114	6,628	60%
Lippo Bank	8,737	4,787	55%
Bank Universal	5,063	4,098	81%
Bank Prima Express	584	531	91%
Bank Bukopin	476	370	78%
Bank Arta Media	165	130	79%
Bank Patriot	62	51	83%
Total	26,201	16,595	63%
Source: IBRA			

All State Banks Recapitalized

The state-owned banks were deemed so important to national development that they were recapitalized regardless of their capital ratios. The government plans to complete the recapitalization of BNI, BRI, and BTN and allow them to continue operating as separate entities. The remaining four banks (Bank Bumi Daya, Bank Dagang Negara, Bank Exim and Bapindo) were merged to form Bank Mandiri.

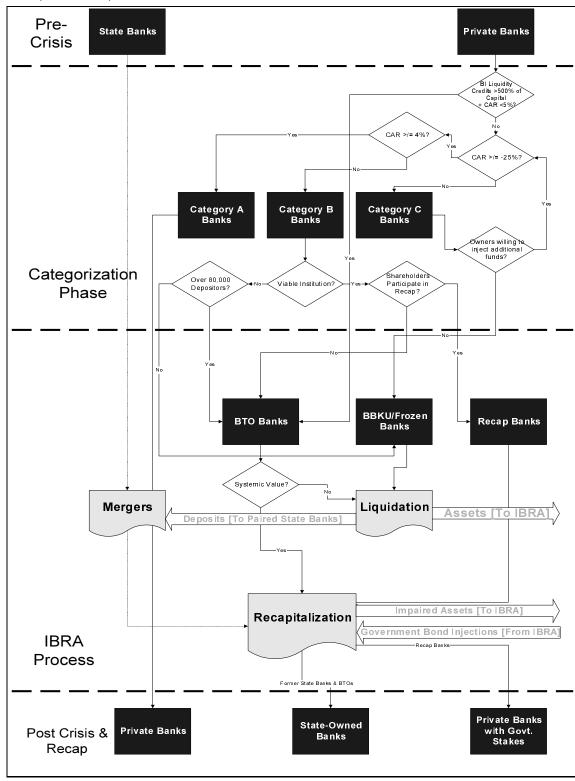

Liquidated and Merged Banks

To date, 48 banks have had their operations frozen. This group includes 10 whose operations were frozen in April 1998 and 38 banks whose commercial activities were frozen in March 1999. Additionally 13 banks have been taken over by IBRA; of these 61 banks only BCA, Danamon, Niaga and Bali survive.

Bank Tiara Asia, Bank PDFCI, Bank Duta, Bank Nusa Nasional, Bank Pos, Bank Jaya, Bank Tamara, Bank Rama, and Bank Risjad Salim International were merged into Bank Danamon in mid-2000. All other banks underwent the following wind-down process:

- Payment of Bank Liabilities. In accordance with the government's guarantee program, IBRA will pay all the eligible liabilities of the taken over and frozen banks.
- Transfer of Bank Assets. All the assets of banks whose operations have been frozen were transferred to IBRA.
- Management of Bank Assets. IBRA continues to service performing loans and restructure NPLs.
- Shareholder Settlements. If there were any violations of banking regulations by a bank's controlling shareholders, IBRA seeks to recover the liabilities from the former controlling shareholders.
- Liquidation. Any restructured or performing assets are sold or transferred to one of the IBRA portfolio entities for later packaging and auction, branches are closed, and operations cease.

Indonesia by the Numbers

Although so much of the country's banking sector is not public, the tremendous effect that these companies exert on the industry as a whole, as well as the likelihood of additional IPOs and secondary government sales over the next year, make it desirable to present comparisons not only between the listed banks, but among the primary government banks as well. Note that all figures are as of 3Q00, with the following caveat: Bank Bali was recapitalized after September 30; where possible we have presented both 3Q00 actuals and our estimate of a recapitalized pro-forma highlighted as such.

BANK CENTRAL ASIA (BCA) (IDR1,625) 1-STRONG BUY

Investment Summary

BCA's strong financial condition makes it the country's premier bank, and gives it a significant advantage over all of its domestic competitors, as it is the only major Indonesian bank to be completely free from asset quality and capital-raising issues. BCA is also well positioned to benefit from the burgeoning consumer lending market due to its existing relationships with eight million consumers, leading branch and ATM networks, and status as Indonesia's *de facto* national payments system.

We believe strongly that the potential return of BCA outweighs the very real risks of investing in Indonesia, thus our 1-Strong Buy rating price target of IDR1,950.

Key Points

- Pristine Balance Sheet: BCA has had the vast majority of its NPLs stripped away by the Indonesian government, leaving the bank with the cleanest asset book in our Asian universe. The bank will be able to fund capital needs internally for the foreseeable future, so that the likelihood of dilutive issuances in the short term is small.
- Cheap Valuation: Although BCA is one of the only bank stocks to post gains in 2000, the shares remain inexpensive, at less than 80% of book value and 1.3x adjusted book. On an earnings basis, BCA trades at 4.8x our estimate of FY2000 earnings—among the lowest valuations in the sector.
- Loan Growth is Steady But Unspectacular: Total loans grew by 11% in the quarter, for a year-on-year change of 54%, albeit off a very low base. The loan-to-deposit ratio is now 7%, up from 5% at 1Q00. Management claims to be on course to reach its target of IDR7.7 trillion of loans on balance sheet by year-end, which would put the bank well ahead of our forecast of IDR7 trillion. However, BCA will continue to be underlevered for the foreseeable future.
- Capital Management: BCA remains well capitalized, with an estimated CAR of 41%, despite the additional risk-weighted assets put on by loan purchases. With no M&A on the horizon, management is now considering share buybacks or dividends beginning in FY2002. Any dividend would require special dispensation from capital market regulators, as Indonesian companies are generally not permitted to pay dividends until they clear any accumulated deficit. While BCA could easily reorganize the capital structure so as to eliminate this deficit, under current tax laws the bank would lose its ability to use accumulated tax loss carry-forwards.
- Profitability: BCA earned an ROAA of 1.40% in 3Q00—a solid result—for a total YTD ROAA of 0.88%. The bank's ROAE for the quarter was 43.1%; we expect a full year ROAE of 33.73%.
- Rates & Margins: Net interest margin in the most recent quarter was robust at 2.92%, well above the 1Q level of 2.01% as deposit book management has allowed

management to lag rising interest rates on the funding side. The bank's cost of funds has been comparatively stable at 9.43% in 3Q00 versus actual 2Q00 COF of 9.13%, even as the reference SBI rate has risen from 11.1% to 13.3%. This has been due to a planned roll-off of expensive time deposits (the bank's interest spread on these deposits is generally less than 50 basis points), which has been effected by lowering rates so as to make BCA's CDs unattractive to price-sensitive consumers.

Time deposit balances currently stand at around IDR28.5 trillion, down from IDR42 trillion at year-end 1999, and management projects a further reduction to IDR25 billion over the next few months. To further trim unprofitable balances, BCA has raised the minimum initial deposit on its popular Tahapan account ten-fold, to IDR500,000, although it has not changed the requirements for existing customers. Even so, BCA reports that the bank is still adding 100,000 Tahapan accounts each month.

- Branch Network: BCA has no plans to expand its current branch network of 795 branches, and in truth a smaller footprint of approximately 600 branches is probably more sustainable in the long run. However, the bank does intend to keep expanding its ATM network, with plans to add 200 machines a year to the existing base of 1770. BCA will open up this proprietary network to selected small banks (with which it does not directly compete) such as NISP in return for transaction fees.
- Acquisition Strategy: The bank is not actively searching for major acquisitions at this time, although management seems willing to consider purchasing small merchant banking operations to fill out its loan and bond syndication capacity.

LIPPO BANK (IDR50.00) 2-BUY

Investment Summary

Lippo is a medium-sized but dynamic player with a strong brand name, well-positioned branch network and retail customer base, and savvy marketing ability. The bank has largely completed its recapitalization and is operating under private management, with the support of an experienced foreign management team. With much of Indonesia's banking sector tied up in the form of monolithic state banks (BNI, Mandiri, BRI) or unrecapitalized zombie banks under IBRA conservatorship (Bank Bali, Niaga), Lippo has a free hand to take share of the plum consumer and SME markets.

Although we expect Lippo to outperform the local market, we continue to maintain our underweight position on the Indonesian bank sector, as well as our global underweight in financial institutions. At the current time, we would recommend that investors seeking Indonesian exposure confine their positions to BCA. However, any broad recovery in the Indonesian political and macroeconomic environment will be positive for Lippo Bank due to its greater leverage. We rate the shares of Lippo as 2-Buy, with a twelve-month price target of Rp85.

Key Points

■ Management: The bank is currently managed under a three-year contract with ING Bank, under which ING has provided Lippo's President and CEO, Ian Clyne, and a team of twelve executives who act as advisors to the Board. Each Board member has an ING team advisor assigned directly to him, and is directly responsible for an operating area or business line. ING performed a thorough financial and business audit of the bank in mid-1999, and has since undertaken to remedy deficiencies in the strategy and operations of the institution.

While ING has disclaimed any intention of taking an equity stake in the bank, and is being compensated on a fee plus performance bonus basis, we would be not at all surprised to see a strategic stake or outright acquisition of Lippo by ING in the future.

- Customer Base: Lippo, although small compared to the pre-crisis state banks and BCA, has an enviable franchise base among both consumers and corporates. Like most other private conglomerate banks, Lippo Bank formerly had an extensive lending relationship with its group affiliates, such as Lippo Land. However, the bulk of these loans were repaid as a condition of the approval of the bank's recapitalization plan by the government. In addition, Lippo has attracted consumers by a combination of savvy marketing and comparatively nimble execution.
- Funding Book: Lippo has been aggressive in seeking savings and demand deposits while rolling off marginally-profitable time deposits—we believe this to be a shrewd strategy overlooked by most of the local banks either because of poor liquidity or poor asset/liability management. While BCA is pursuing a similar strategy, Lippo's

differs in that it has introduced a fee-free savings account with a minimum deposit of only Rp10,000, against BCA's new minimum of Rp500,000.

Although the account has tiered interest rates and frequently pays depositors very low rates, customers are so fed up with spiraling bank charges that Lippo has picked up 200 thousand accounts in just over a month, while maintaining a spread averaging 4%. Management believes that savings deposits can be sustainably grown at 4–7% per year over the next few years.

Lending: Lippo's SME business is generating approximately Rp50 billion per month in new originations, mainly in the retail, tobacco, and pharmaceuticals industries—not enough to lever the organization from its 23% loan-to-deposit ratio but a fairly good start.

Consumer lending, given Lippo's brand image, customer base, and excellent marketing ability, is a natural extension, and the bank has been working to broaden its product line with innovative structures. Mortgages, still a fairly new product for banks, offer tiered interest rates based on loan-to-value, exactly the type of explicit credit-risk pricing that Asia has been conspicuously lacking. Additionally, Lippo is willing to extend residential mortgages of up to 20 years, a longer term than any other bank now offers.

Credit and Debit Cards: Lippo was marginally active in credit cards pre-crisis, although it wound up with Rp24 billion in write-offs. The bank is now placing new emphasis on this area, having just hired away Citibank's Indonesian card manager.

In the interim, the real action is in debit cards, where Lippo has scaled up to over 1 million Visa debit cards through the Electron program. The attraction of this product from a customer's perspective is that the Electron card is signature-based rather than PIN-based, and so is easier for merchants to implement and more comfortable for consumers to carry and use. As over 500,000 of the debit cards represent new customers, it is evident that Lippo's product differentiation in this area is paying dividends.

- Asset Quality: Lippo's asset quality remains poor even post IBRA cleansing; however, we consider the bank effectively fully provisioned against losses from these legacy bad assets, with our theoretical required reserve 88% met by Lippo's actual reserves and the difference amounting to only 7% of book equity.
- Capital: Lippo currently has a high CAR of 19.65%, primarily due to the large amount (Rpó trillion, or 28% of assets) of zero-weighted government bonds on the books. However, we estimate that the bank could add an additional Rp7 trillion in fully-weighted loans while maintaining a CAR of 12%+, well within the realm of safety. For this reason, we do not believe that Lippo will have to come to market for equity in the next 12 months, although abundance of caution or an acquisition opportunity could bring an offering if the market is favorable.

■ Ownership: Lippo's major shareholders include IBRA, which owns 59% of the company, and Lippo E-Net (the former Lippo Life Insurance), which remains controlled by the Riady family and owns 7.2% of the bank. Public float is approximately 33%.

PANIN BANK (IDR170.00) 3-MARKET PERFORM

Investment Summary

Panin was the only significant bank in Indonesia to be rated a Category A bank under the bank recapitalization program implemented by IBRA, and as such received no government funds. Ironically, while Panin's less-prudent competitors, such as BCA and Lippo, are now relatively healthy due to infusions of recap bonds and the removal of their category five (loss) loans, Panin remains beset by asset quality difficulties. 25% of Panin's total asset base is comprised of various non-performing or criticized assets, versus 15% for Lippo Bank and less than 0.5% for BCA.

In addition, we have doubts about the bank's strategic plan, which calls for turning what was a small corporate lender into a retail bank and dramatically expanding the branch network. Although we agree that the consumer lending space is an attractive one, we note that Panin has no experience in the sector, which is becoming more competitive by the day. On the positive side, Panin does have a strong foreign partner and beefy capital base, and trades at a fairly cheap valuation.

Nevertheless, given our poor overall view of the sector, and the availability of opportunities in franchises which we would prefer to this one, we rate the shares of Panin as only 3-Market Perform.

Key Points

- Asset Quality: Panin is still in restructuring mode, with the primary method for cleaning up the balance sheet (still 41% NPLs/loans) being write-offs. Most of Panin's NPLs are syndicated loans, so that IBRA and the lead banks are driving the workout process. Management expects a further Rp1.1 trillion in provisions will be needed in FY2001-02 to cover gross NPLs of Rp3.2 trillion. This amount represents 11.8 quarters of net interest income at the 2Q00 level, indicating that provisions will continue to drive Panin's profitability.
- Reserve Adequacy: We consider Panin's reserves inadequate by our methodology, with actual consolidated reserves of Rp858 billion meeting only 49% of our requirement of Rp1.75 billion—a shortfall equivalent to 31% of Panin's total capital. Management's provisioning plan appears to be sufficient to cover this over the next two years, barring further deterioration, but this will be a severe drag on earnings.
- Loan Growth: Management predicts loan growth of Rp500 billion in 2H00 (with growth of Rp3.5 trillion already seen in 1H00) and Rp1 trillion in FY2001, which appears reasonable given that Panin's large competitors are still at earlier stages of their recoveries. Loan growth is projected at a 50/50 mix of consumer and corporate, with state-owned enterprises making up most of the corporate lending. We are, to say the least, not crazy about this SOE strategy, and we question Panin's ability to enter the consumer market and maintain profitability and asset quality.

152 January 8, 2001

ANZ Partnership: Panin has a fairly deep relationship with Australia's ANZ Bank, which encompasses an equity stake, joint venture, and management support. ANZ now owns approximately 10% of Panin, with options to purchase 18% more from the controlling family interests.

In addition, Panin and ANZ are partners in an Indonesian joint venture bank, PT ANZ Panin Bank, of which ANZ owns 85%. ANZ Panin has a deposit taking and lending operation, and also purchased the credit card operations of the former Bank Papan Sejahtera from IBRA in mid-1998. From a base of 47,000 cards, this operation has now grown to 70,000.

- Capital: Panin has a high CAR of 51% due to its relatively unlevered balance sheet and high book equity of 22% of assets. We note that book value no longer includes any material asset revaluation; the revaluation on computer equipment which was taken in 1999 has been reversed, and there are no capitalized tax loss carryforwards on the balance sheet. Therefore, our major adjustment to book value is reserve underfunding.
- IT and Technology: Panin has the usual quota of IT improvements either in place or on the way. Mobile banking is now in place, with a 24-hour call center scheduled to go live this month. Internet banking using the ANZ platform is scheduled for a January 2001 launch, not a major factor given the paucity of net users in the country.
- Branch Network: Panin has grown from 100 branches pre-crisis to 110 now, mainly in metro Jakarta and Java. While management has spoken in the past of taking this branch network up to the 200-300 level, this is now being downplayed—a good idea in our opinion. The bank has been steadily adding ATMs, however, going from 62 pre-crisis to 140 currently.
- Valuation: Panin now trades at only 35% of stated book value; however, we feel that this book value is overstated. Subtracting our estimate of reserve underfunding Panin trades at 45% of book value, which still looks to be a bargain level. However, Panin's NPLs are more severe than those of the other extant Indonesian banks, as its Category 5 (Loss) loans have not been removed by IBRA.

Given that the oversight and due diligence on the portfolio has been at a lower level, and that the bank has had no incentive to disclose NPLs (whereas Category B and C banks had incentive to show as many NPLs as possible in order to have them removed and increase their recapitalization funds), we believe that there is still a wide margin for error in reported numbers, and true price-to-book valuations may be considerably higher than even our adjusted numbers.

On an earnings basis, Panin trades at 21.1x our FY2000 estimates, and at 6.9x FY2001 projections. While not in itself high, this level is above the earnings valuation of BCA and presents a less attractive risk-reward tradeoff.

PHILIPPINE BANKS

The catalyst for a strong rally in Philippine bank share prices, and indeed the whole market, can be summarized in one word: IMPEACHED. When charges of graft and corruption against President Estrada surfaced in October 2000, the stock market sank to levels not seen since the 1997 financial crisis. Unfortunately, the on-going impeachment process has seriously damaged both investor and businessmen confidence, which will adversely impact the overall economy in the coming quarters, even if the president is removed from office. Consequently, we do not see loan growth picking up significantly, especially since the NPL cycle is still in the upswing. Investors should remain UNDERWEIGHT the sector.

Huge political overhang

The Philippines continues to be plagued with political uncertainties. The on-going impeachment trial of President Estrada is expected to drag onto 1Q01, even though the Senate has publicly stated that the trial would end before the end of December 2000. The longer the impeachment process drags on, the more the overall economy would suffer since business confidence would be weak. The prevailing view is that President Estrada will eventually be acquitted, which translates to possibly another four years of political and economic uncertainty (his term ends in 2004).

While we believe that the market would react positively if the president were found guilty and removed from office, the economy has already sustained enough damage such that it would take at least another twelve months for recovery take place. As such, work would definitely be cut out for Vice President Gloria Macapagal Arroyo, who would assume the presidency if President Estrada were impeached. As pointed out by our economist, the government (incumbent or new) must urgently address perceptions of a policy vacuum in Philippine politics and strive to rebuild confidence.

Anemic loan growth

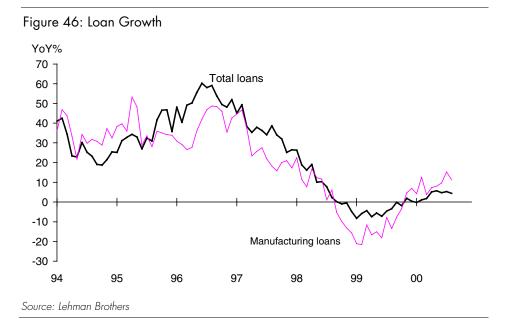

Ever since the corruption charges against President Estrada were made in October 2000, the local banks reported that loan demand had weakened. The reasons for the weakness were (i) higher interest rates to curb the sliding peso and (ii) declining business confidence. Most local bankers concur that the political uncertainty will continue to depress economic activity and the banks forecast 2001 GDP to be only 3% to 3.5%, in line with our Lehman economist's forecast of 3.1%, which is a deceleration from this year's expected 4.0% growth.

In the first eight months of 2000, overall loan growth in the system has grown 4.4%. However, the operating environment has since deteriorated as the central bank increased interest rates by four percentage points and increased the banks' reserve requirements by 400bps in October 2000. These moves were aimed at curbing the slide in the currency. With higher cost of money, we expect loan growth to weaken in this quarter and in 1Q01.

One of the drivers for the economy and loan growth has been the manufacturing sector, which accounts for almost 30% of total loan demand. Within this sector, electronics-related manufacturing has been especially robust. Indeed, electronics exports have been one of the saving graces for the Philippine economy. Unfortunately, with US demand, the country's largest trading partner, expected to slacken in the coming quarters, electronics exports and thus loans flowing into this segment is also expected to slow.

On mortgage lending, while there is inherent demand for new homes from the middle-income families, no one is willing to buy a home given the political and sporadic social uncertainties. Coupled with a volatile interest rate environment, we do not expect demand for mortgage loans to pick up in the next twelve months.

Against the difficult operating backdrop we expect over the next few months, we believe loan growth will remain in single digits, a view held by most bank management. We forecast loan growth of 3.5% in 2000 and 6% in 2001. The banks are targeting a slightly higher 8% to 9% for 2001.

Non-performing assets still rising

Non performing loans in the sector continued their upward trend throughout 3Q00. From 14.6% in June 2000, NPLs account for 15.6% of total loans as of October 2000. We would also highlight that if we include 6.5% of foreclosed loans (termed ROPOA in the Philippines), total NPAs would reach 21.8%. Looking ahead, the downturn in industrial production and business sentiment in 4Q00, coupled with interest rate increases to defend the sliding peso, would translate to further rises in NPLs over the next two quarters at least. We forecast NPLs to reach 16.5% in 2000 and 18% in 2001.

156 January 8, 2001

As in Taiwan, there are no government-funded AMCs, which could facilitate the management and monetization of the banks' NPLs and collateral. This is in part due to the banks' continued belief that the collateral, which is largely real estate, will eventually increase in value. While we would concur that property prices do move in cycles, some down-turns can and do last many years. It has been four years since property prices fell in the Philippines and all this time the increasing ROPOAs are weighing down the banks' balance sheets and impeding profitability. The banks should be more pro-active in forming either a consortium to manage the sector's NPLs, or be willing to sell-off these non-performing assets (even at a discount) so that the cash received can be put into some revenue-generating assets.

Recommended exposure

Given that the NPL cycle has yet to peak, with slow loan growth prospects and high investment risk stemming from the political arena, we maintain our Underweight position in Philippine banks. For any country-dedicated funds, we would focus on banks with superior asset quality and thus would only recommend Bank of the Philippine Islands, its richer valuations notwithstanding. Especially in times of political and economic uncertainty, BPI has always been regarded as a safe haven bank and should benefit from deposit inflows.

LEHMAN BROTHERS January 8, 2001 157

BANK OF THE PHILIPPINE ISLANDS (P58.00) 2-BUY

Investment Case

Smooth merger with FEB; full integration expected by 1001

Bank of the Philippine Islands (BPI) officially merged with Far East Bank in April 2000 to form the country's second largest bank. Management has been very successful in reducing the combined headcount. Even prior to the official merger in April, the two banks have already reduced the combined headcount by 1,300 and as of end-September 2000, BPI managed to cut a further 2,000-odd personnel. The reduction were achieved via a combination of natural attrition and offering early retirement packages. Management expects total headcount to be further reduced in 1Q01 as all branches are fully rationalized.

FEB adds middle market exposure to loan portfolio

Prior to the merger with FEB, BPI has largely focused on the top corporate sector and the consumer sector. The FEB loan increased the merged bank's exposure to the middle market segment. The bank currently has 42% of its loan book exposed to top corporates, 40% middle market and 18% consumer. In 2001, management aims to increase its market share in top corporates and consumer banking. We forecast overall loan growth to improve from an estimated 3% in 2000 to 6% in 2001.

Beneficiary of political and economic uncertainty

BPI has traditionally been viewed as a bastion of sound banking in the Philippines. This reputation is largely due to its competent and conservative management, which is reflected in its superior asset quality and strong overall balance sheet. The fact that the Ayala family (34% stake) and DBS (21% stake) are major shareholders in BPI further strengthens the perception of it being a safe haven bank. Consequently, the bank has been experiencing inflow of deposits during unstable times, especially with the recent political turmoil created by the impeachment of President Estrada and the implication of some banks by the proceedings.

Sound balance sheet

Management has always paid very close attention to its asset quality by instituting prudent credit policies. While it cannot escape unscathed from the financial crisis, its NPL ratio has always been the lowest in the sector and did not reach double-digit levels during the crisis. Even though the merger with FEB caused the combined NPL portfolio to rise to 12.8% as of September 30, 2000, it is still considerably lower than the sector's NPL ratio of 15.6%. More importantly, BPI has demonstrated its willingness to strengthen its asset quality by setting aside more provisions at the expense of short-term profitability. The bank has an NPL coverage ratio of 50% as of end-3Q00, which it aims to improve to 55%-60% by the end of 2000. This compares with an NPL coverage ratio of 44% for the sector.

Valuation

Although BPI, at 1.7x PBR, is trading at a premium to the other banks in the sector, we believe it is well-justified given its superior balance sheet, well-regarded management team and respected major shareholder groups. This is the only bank in the Philippines that we would recommend to investors.

METROPOLITAN BANK AND TRUST (P185.00) 3-MARKET PERFORM

Investment Case

Staying the largest bank with multiple acquisitions

In its pursuit to maintain its status as the largest bank in the country, Metrobank stepped up its acquisition spree when BPI announced its merger with FEB. Metrobank successfully acquired two smaller banks (Philippine Banking Corp and Asian Bank) in late 1999. It followed these acquisitions with yet another purchase, the medium-sized Solidbank in April 2000. While these acquisitions enabled the bank to retain its throne as the largest Philippine bank, it had to incur significant merger-related costs. We note also that since Solidbank was acquired under a purchase accounting method, Metrobank incurred P6.5 billion of goodwill. Assuming a 40-year amortization schedule, the bank will be recording a goodwill expense of P163 million each year.

Rapid deterioration in asset quality; NPL coverage is one of the lowest The acquisition of Solidbank also significantly increased Metrobank's NPLs from 14.5% in June 2000 to 18% in September 2000. Consequently, the bank has to also set aside much higher provisions. In the first nine months, it set aside P1.4 billion of provisions, more than 50% more than the year-ago period. We would highlight, however, that despite higher provisions, Metrobank still has one of the lowest NPL coverage ratios in the sector at 33%. The comparable ratio for the sector is 44%. Management has stated that it aims to set aside an additional P600 million in 4Q00, which we estimate would only improve its NPL ratio marginally to 35%. Once again, Metrobank is still lagging the other banks in strengthening its loan loss reserve position.

Focusing on consumer for growth

Metrobank's niche has traditionally been serving the middle market, especially businesses run by Chinese-Filipinos. The middle market segment accounts for 50% of the bank's loan portfolio. The growth of this market segment is closely linked with the overall economy. With our pessimistic view of the Philippine economy this year, we believe that loan growth demand will be sluggish for Metrobank. Management appears to recognize this as it has stated that it would focus on the consumer sector to drive loan growth in 2001. We believe it will face stiff competition from BPI as this bank is the leading bank for consumer loans. As a result, we suspect that management's loan growth target of 10% this year might be too optimistic. We forecast a slightly lower loan growth of 8%.

Open for foreign strategic partner

Management has stated that it is willing to have foreign banks as strategic shareholders. Thus far, one Asian bank and one European bank have reportedly expressed interest in Metrobank. While the local press reported that majority shareholder George Ty is willing to sell 20% of his 65% effective stake in the bank, we find it unlikely that he is willing to reduce his stake to less than 50%.

Valuation

The stock has slightly under-performed the broader market by 7% in 2000, and is trading at 1.2xPBR. While such valuation is undermanding, we believe the market should continue attach a discount to its valuations given its lower-than-average asset quality.

PHILIPPINE NATIONAL BANK (P38.00) 4-UNDERPERFORM

Investment Case

Continues to be hounded by poor asset quality

It has been more than three years since the financial crisis hit the Philippine banking sector, and PNB is still struggling to get back on its feet. The bank has reported huge losses in 1998 and 1999, and it is still very much in the red as of September 30, 2000. One of the key reasons for its poor performance is that its balance sheet is laden with NPLs and ROPOA (or foreclosed assets). At 38% as of end-3Q00, PNB has the highest NPL ratio in the sector. And if we include its ROPOA portfolio, total non performing assets (NPA) stand at a staggering 49%. Management has been dragging its feet in disposing of its NPAs and a complete review of its existing loan portfolio. Consequently, it has to keep setting aside huge provisions just to be able to maintain its NPL coverage ratio at about 41%.

Capital infusion is useless unless NPAs are cleaned up

Having sustained heavy losses in 1998, PNB had to tap shareholders for fresh capital in order to meet minimum capital adequacy requirements. No minority shareholders were willing to inject new money, while the government (which is the majority shareholder) had a huge fiscal deficit to contend with and as such was in no position to subscribe to the rights issue. Lucio Tan, a prominent Chinese-Filipino businessman, came to the rescue by taking up the unsubscribed shares and the bank managed to raise P9.4 billion. The fresh funds were promptly virtually wiped out as the bank reported another loss of P8.52 billion in 1999 on the back of further provisions. We believe that management has to undergo a thorough review of its assets, be willing to self-off its NPLs and foreclosed assets, even at a discount. Until that is done, any new capital put into the bank would simply be used up.

Ownership issue is an added overhang

While Lucio Tan, who currently has a 70% stake, has indeed invested a lot of his money into the bank, the market has been very skeptical of his management. It is widely known that Lucio Tan is a close friend of President Estrada, which has led to PNB being labeled a crony bank. Indeed, the process by which he came to control one of the nation's largest bank has been questioned by many industry observers. Additionally, the bank received P25 billion in loans from the BSP and PDIC in October 2000, after the bank reportedly encountered massive withdrawals. This led to accusations that the bank was able to obtain such a huge amount so quickly because of cronyism. Such events underscore our view that PNB not only has to clean up its balance sheet, but also regain investor confidence that its transactions are all above board.

Valuation and recommendation

Given its weak financial position and lingering uncertainties over treatment of minority shareholders, it is perhaps not surprising that the stock has languished in the past 12 months, underperforming the sector by 30%. With no clear indications that management is seriously cleaning up its balance sheet and with ownership issues remaining an overhang, we have downgraded the stock to 4-Market Underperform.
